

## FEATURES

- ▶ Industrial Standard SIP-7 Package
- ▶ Ultra-high I/O Isolation 5200VDC
- ▶ Common Mode Transient Immunity : 15KV/ $\mu$ s
- ▶ Qualified for IGBT and High Isolation Applications
- ▶ Operating Temp. Range -40°C to +88°C
- ▶ UL/cUL/IEC/EN 60950-1 Safety Approval(Pending)

## PRODUCT OVERVIEW

The MINMAX MAEU02-HI series is a new range of isolated 2W DC/DC converter modules in SIP-7 package which feature a very high I/O-isolation voltage rated for 5700VDC. A very high common mode transient immunity with 15KV/ $\mu$ s qualifies these product for IGBT driver applications. There are 40 models available for 5, 12, 15 and 24V input. These converters offer a cost-effective solution for wind turbine, solar panel, transportation systems, industrial control equipments and some IGBT driver applications where a very high I/O-isolation is required.

### Power Derating Curve

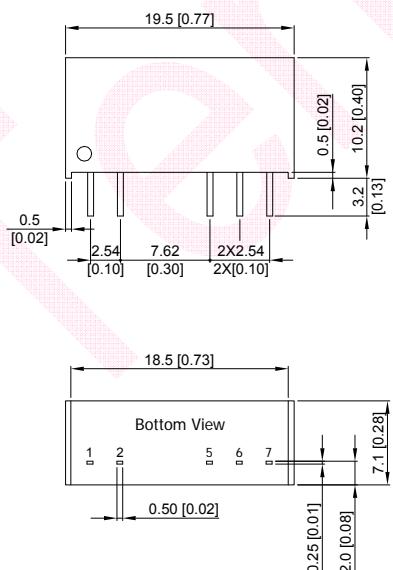

### Notes

- 1 Specifications typical at  $T_a=+25^\circ\text{C}$ , resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 These power converters require a minimum output loading to maintain specified regulation, operation under no-load conditions will not damage these modules; however they may not meet all specifications listed.
- 3 We recommend to protect the converter by a slow blow fuse in the input supply line.
- 4 Other input and output voltage may be available, please contact factory.
- 5 That "natural convection" is about 20LFM but is not equal to still air (0 LFM).
- 6 Specifications are subject to change without notice.

## Test Setup

### Peak-to-Peak Output Noise Measurement Test

Use a  $C_{out}$   $0.33\mu F$  ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC/DC Converter.

## Technical Notes

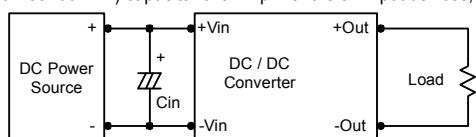

### Maximum Capacitive Load

The MAEU02-HI series has limitation of maximum connected capacitance at the output. The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time. The maximum capacitance can be found in the data sheet.

### Input Source Impedance

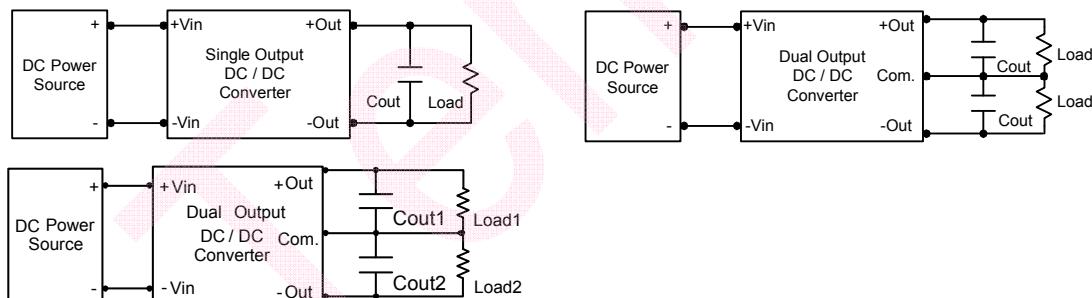

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup.

Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR <  $1.0\Omega$  at 100 KHz) capacitor of a  $2.2\mu F$  for the 5V input devices, a  $1.0\mu F$  for the 12V,15V input devices and a  $0.47\mu F$  for the 24V devices.

### Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use  $1.0\mu F$  capacitors at the output.

### Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below  $100^\circ C$ . The derating curves are determined from measurements obtained in a test setup.
