## 16-BIT 250-KSPS SAMPLING CMOS ANALOG-TO-DIGITAL CONVERTER

## FEATURES

- 105dB SFDR at 250-kHz Sample Rate
- Standard $\pm 10-\mathrm{V}$ Input Range
- $\pm 1.5$ LSB Max INL
- $\pm 1$ LSB Max DNL, 16-Bits No Missing Codes
- $\pm \mathbf{2}$ mV Max Bipolar Zero Error With $\pm 0.4$ PPM $/{ }^{\circ} \mathrm{C}$ Drift
- $\pm 0.1 \%$ FSR Max Full-Scale Error With $\pm 2$ PPM $/{ }^{\circ} \mathrm{C}$ Drift
- Single 5-V Supply Operation
- Pin-Compatible With ADS7805 (Low Speed) and 12-Bit ADS8504/7804
- Uses Internal or External Reference
- Full Parallel Data Output
- 70-mW Typ Power Dissipation at 250 KSPS
- 28-Pin SSOP and SOIC Packages

## APPLICATIONS

- Industrial Process Control
- Data Acquisition Systems
- Digital Signal Processing
- Medical Equipment
- Instrumentation

## DESCRIPTION

The ADS8505 is a complete 16 -bit sampling $A / D$ converter using state-of-the-art CMOS structures. It contains a complete 16-bit, capacitor-based, SAR A/D with S/H, reference, clock, interface for microprocessor use, and 3-state output drivers.
The ADS8505 is specified at a $250-\mathrm{kHz}$ sampling rate over the full temperature range. Precision resistors provide an industry standard $\pm 10-\mathrm{V}$ input range, while the innovative design allows operation from a single $+5-\mathrm{V}$ supply, with power dissipation under 100 mW .

The ADS8505 is available in 28-pin SOIC and 28-pin SSOP packages, both fully specified for operation over the industrial $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ temperature range.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## PACKAGE/ORDERING INFORMATION ${ }^{(1)}$

| PRODUCT | MINIMUM RELATIVE ACCURACY (LSB) | $\begin{gathered} \text { NO } \\ \text { MISSING } \\ \text { CODE } \end{gathered}$ | MINIMUM SINAD (dB) | SPECIFICATION TEMPERATURE RANGE | PACKAGE LEAD | PACKAGE DESIGNATOR | ORDERING NUMBER | TRANSPORT MEDIA, QTY |

(1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)}$

over operating free-air temperature range (unless otherwise noted) ${ }^{(2)}$

|  |  |  |
| :--- | :--- | :---: |
| Analog inputs | $\mathrm{V}_{\text {IN }}$ | UNIT |
|  | REF | $\pm 25 \mathrm{~V}$ |
|  | CAP | $+\mathrm{V}_{\text {ANA }}+0.3 \mathrm{~V}$ to AGND2 -0.3 V |
| Ground voltage differences | DGND, AGND1, AGND2 | Indefinite short to AGND2, momentary short to $\mathrm{V}_{\text {ANA }}$ |
|  | $\mathrm{V}_{\text {ANA }}$ | $\pm 0.3 \mathrm{~V}$ |
|  | $\mathrm{~V}_{\text {DIG }}$ to $\mathrm{V}_{\text {ANA }}$ | 6 V |
|  | $\mathrm{~V}_{\text {DIG }}$ | 0.3 V |
| Digital inputs |  |  |
| Maximum junction temperature | 6 V |  |
| Internal power dissipation |  | -0.3 V to $+\mathrm{V}_{\mathrm{DIG}}+0.3 \mathrm{~V}$ |
| Lead temperature (soldering, 10s) | $165^{\circ} \mathrm{C}$ |  |

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to network ground terminal.

## ELECTRICAL CHARACTERISTICS

$\mathrm{T}_{\mathrm{A}}=-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}, \mathrm{f}_{\mathrm{s}}=250 \mathrm{kHz}, \mathrm{V}_{\mathrm{DIG}}=\mathrm{V}_{\mathrm{ANA}}=5 \mathrm{~V}$, using internal reference (unless otherwise noted)

(1) LSB means least significant bit. For the 16 -bit, $\pm 10-\mathrm{V}$ input ADS8505, one LSB is $305 \mu \mathrm{~V}$.
(2) Typical rms noise at worst case transitions and temperatures.
(3) As measured with fixed resistors shown in Figure 27. Adjustable to zero with external potentiometer.
(4) Full-scale error is the worst case of -full-scale or +full-scale deviation from ideal first and last code transitions, divided by the transition voltage (not divided by the full-scale range) and includes the effect of offset error.
(5) All specifications in dB are referred to a full-scale $\pm 10-\mathrm{V}$ input.
(6) Full-power bandwidth is defined as the full-scale input frequency at which signal-to-(noise + distortion) degrades to 60 dB , or 10 bits of accuracy.
(7) Recovers to specified performance after $2 \times$ FS input overvoltage.

| TERMINAL |  | $\begin{gathered} \text { DIGITAL } \\ \text { I/O } \end{gathered}$ | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | DB/DW NO. |  |  |
| AGND1 | 2 |  | Analog ground. Used internally as ground reference point. |
| AGND2 | 5 |  | Analog ground. |
| $\overline{\text { BUSY }}$ | 26 | 0 | At the start of a conversion, BUSY goes low and stays low until the conversion is completed and the digital outputs have been updated. |
| BYTE | 23 | 1 | Selects 8 most significant bits (low) or 8 least significant bits (high). |
| CAP | 4 |  | Reference buffer capacitor. 2.2- $\mu \mathrm{F}$ Tantalum capacitor to ground. |
| $\overline{\text { CS }}$ | 25 | 1 | Internally ORed with R/ट्ट. If R/亚 is low, a falling edge on $\overline{\mathrm{CS}}$ initiates a new conversion. |
| DGND | 14 |  | Digital ground. |
| D15 (MSB) | 6 | 0 | Data bit 15. Most significant bit (MSB) of conversion results. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when $R / \bar{C}$ is low. |
| D14 | 7 | 0 | Data bit 14. $\mathrm{Hi}-\mathrm{Z}$ state when $\overline{C S}$ is high, or when $\mathrm{R} / \mathrm{C}$ is low. |
| D13 | 8 | 0 | Data bit 13. Hi-Z state when $\overline{C S}$ is high, or when R/C is low. |
| D12 | 9 | 0 | Data bit 12. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when $\mathrm{R} / \overline{\mathrm{C}}$ is low. |
| D11 | 10 | 0 | Data bit 11. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D10 | 11 | 0 | Data bit 10. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D9 | 12 | 0 | Data bit 9. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D8 | 13 | 0 | Data bit 8. Hi-Z state when $\overline{C S}$ is high, or when R/C is low. |
| D7 | 15 | 0 | Data bit 7. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D6 | 16 | 0 | Data bit 6. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D5 | 17 | 0 | Data bit 5. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D4 | 18 | 0 | Data bit 4. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D3 | 19 | 0 | Data bit 3. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D2 | 20 | 0 | Data bit 2. Hi-Z state when $\overline{C S}$ is high, or when R/C is low. |
| D1 | 21 | 0 | Data bit 1. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when R/C is low. |
| D0 (LSB) | 22 | 0 | Data bit 0 . Least significant bit (LSB) of conversion results. Hi-Z state when $\overline{\mathrm{CS}}$ is high, or when $R / C$ is low. |
| R/C | 24 | I | With $\overline{\mathrm{CS}}$ low and $\overline{\mathrm{BUSY}}$ high, a falling edge on R/C initiates a new conversion. With $\overline{\mathrm{CS}}$ low, a rising edge on $\mathrm{R} / \mathrm{C}$ enables the parallel output. |
| REF | 3 |  | Reference input/output. 2.2- $\mu \mathrm{F}$ Tantalum capacitor to ground. |
| $\mathrm{V}_{\text {ANA }}$ | 27 |  | Analog supply input. Nominally +5 V . Decouple to ground with $0.1-\mu \mathrm{F}$ ceramic and $10-\mu \mathrm{F}$ tantalum capacitors. |
| $\mathrm{V}_{\text {DIG }}$ | 28 |  | Digital supply input. Nominally +5 V . Connect directly to pin 27 . Must be $\leq \mathrm{V}_{\text {ANA }}$. |
| $\mathrm{V}_{\text {IN }}$ | 1 |  | Analog input. See Figure 28. |

Figure 20.

## BASIC OPERATION

Figure 21 shows a basic circuit to operate the ADS8505 with a full parallel data output. Taking R/C (pin 24) low for a minimum of $40 \mathrm{~ns}(1.75 \mu \mathrm{~s}$ max) initiates a conversion. $\overline{\mathrm{BUSY}}$ (pin 26) goes low and stays low until the conversion is completed and the output registers are updated. Data is output in binary 2's complement format with the MSB on pin $6 . \overline{B U S Y}$ going high can be used to latch the data.

## BASIC OPERATION (continued)

The ADS8505 begins tracking the input signal at the end of the conversion. Allowing $4 \mu$ s between convert commands assures accurate acquisition of a new signal.
The offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain are corrected in software (refer to the CALIBRATION section).

## STARTING A CONVERSION

The combination of $\overline{C S}$ (pin 25) and $R / \bar{C}$ (pin 24) low for a minimum of 40 ns immediately puts the sample/hold of the ADS8505 in the hold state and starts conversion n. BUSY (pin 26) goes low and stays low until conversion $n$ is completed and the internal output register has been updated. All new convert commands during $\overline{B U S Y}$ low will abort the conversion in progress and reset the ADC (see Figure 26).

The ADS8505 begins tracking the input signal at the end of the conversion. Allowing $4 \mu$ s between convert commands assures accurate acquisition of a new signal. Refer to table 1 for a summary of CS, R/C, and BUSY states and Figure 23 through Figure 25 for the timing diagrams.
$\overline{\mathrm{CS}}$ and $\mathrm{R} / \overline{\mathrm{C}}$ are internally ORed and level triggered. There is not a requirement which input goes low first when initiating a conversion. If, however, it is critical that $\overline{\mathrm{CS}}$ or $\mathrm{R} / \overline{\mathrm{C}}$ initiates conversion $n$, be sure the less critical input is low at least 10 ns prior to the initiating input.
To reduce the number of control pins, $\overline{\mathrm{CS}}$ can be tied low using $\mathrm{R} / \overline{\mathrm{C}}$ to control the read and convert modes. The parallel output becomes active whenever R/C goes high. Refer to the READING DATA section.

Table 1. Control Line Functions for Read and Convert

| $\overline{\mathbf{C S}}$ | $\mathbf{R} / \overline{\mathbf{C}}$ | $\overline{\text { BUSY }}$ |  |
| :---: | :---: | :---: | :--- |
| 1 | X | X | None. Databus is in Hi-Z state. |
| $\downarrow$ | 0 | 1 | Initiates conversion $n$. Databus remains in Hi-Z state. |
| 0 | $\downarrow$ | 1 | Initiates conversion $n$. Databus enters Hi-Z state. |
| 0 | 1 | $\uparrow$ | Conversion $n$ completed. Valid data from conversion $n$ on the databus. |
| $\downarrow$ | 1 | 1 | Enables databus with valid data from conversion $n$. |
| $\downarrow$ | 1 | 0 | Enables databus with valid data from conversion $n-1^{(1)}$. Conversion $n$ in progress. |
| 0 | $\uparrow$ | 0 | Enables databus with valid data from conversion $n-1^{(1)}$. Conversion $n$ in progress. |
| 0 | 0 | $\uparrow$ | Data is invalid. $\overline{\text { CS }}$ and/or R/C must be high when $\overline{\text { BUSY }}$ goes high. |
| X | $\downarrow$ | 0 | Conversion $n$ is halted. Causes ADC to reset. ${ }^{(2)}$ |

(1) See Figure 23 and Figure 24 for constraints on data valid from conversion n-1.
(2) See Figure 26 for details on ADC reset.

Figure 21. Basic Operation

## READING DATA

The ADS8505 outputs full or byte-reading parallel data in binary 2's complement data output format. The parallel output is active when R/C (pin 24) is high and $\overline{C S}$ (pin 25) is low. Any other combination of $\overline{C S}$ and $R / \bar{C} 3$-states the parallel output. Valid conversion data can be read in a full parallel, 16 -bit word or two 8 -bit bytes on pins $6-13$ and pins 15-22. BYTE (pin 23) can be toggled to read both bytes within one conversion cycle. Refer to Table 2 for ideal output codes and Figure 22 for bit locations relative to the state of BYTE.

Table 2. Ideal Input Voltages and Output Codes

| DESCRIPTION | ANALOG INPUT | DIGITAL OUTPUT BINARY 2'S COMPLEMENT |  |
| :---: | :---: | :---: | :---: |
|  |  | BINARY CODE | HEX CODE |
| Full-scale range | $\pm 10 \mathrm{~V}$ |  |  |
| Least significant bit (LSB) | $305 \mu \mathrm{~V}$ |  |  |
| Full scale $(10 \mathrm{~V}-1 \mathrm{LSB})$ | 9.999695 V | 0111111111111111 | 7FFF |
| Midscale | 0 V | 0000000000000000 | 0000 |
| One LSB below midscale | $-305 \mu \mathrm{~V}$ | 1111111111111111 | FFFF |
| -Full scale | -10 V | 1000000000000000 | 8000 |

## PARALLEL OUTPUT (After a Conversion)

After conversion $n$ is completed and the output registers have been updated, $\overline{B U S Y}$ (pin 26) goes high. Valid data from conversion $n$ is available on D15-D0 (pins 6-13 and 15-22). BUSY going high can be used to latch the data. Refer to Table 3, Figure 23, Figure 24, and Figure 25 for timing specifications.

## PARALLEL OUTPUT (During a Conversion)

After conversion $n$ has been initiated, valid data from conversion $n-1$ can be read and is valid up to $t_{2}(2.2 \mu \mathrm{~s}$ typ) after the start of conversion $n$. Do not attempt to read data from $\mathrm{t}_{2}(2.2 \mu \mathrm{~s}$ typ) after the start of conversion $n$ until BUSY (pin 26) goes high; this may result in reading invalid data. Refer to Table 3, Figure 23, Figure 24, and Figure 25 for timing specifications.
Note: For the best possible performance, data should not be read during a conversion. The switching noise of the asynchronous data transfer can cause digital feedthrough degrading converter performance.

The number of control lines can be reduced by tying $\overline{\mathrm{CS}}$ low while using the falling edge of $\mathrm{R} / \overline{\mathrm{C}}$ to initiate conversions and the rising edge of $\mathrm{R} / \overline{\mathrm{C}}$ to activate the output mode of the converter. See Figure 23 .

Table 3. Conversion Timing

| SYMBOL | DESCRIPTION | MIN | TYP | MAX | UNITS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{w} 1}$ | Pulse duration, convert | 40 |  | 1750 | ns |
| $\mathrm{t}_{\mathrm{a}}$ | Access time, data valid after R/C low |  | 2.2 | 3.2 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{pd}}$ | Propagation delay time, BUSY from R/C low |  | 15 | 25 | ns |
| $\mathrm{t}_{\mathrm{w} 2}$ | Pulse duration, BUSY low |  |  | 2.2 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{d} 1}$ | Delay time, $\overline{\mathrm{BUSY}}$ after end of conversion |  | 5 |  | ns |
| $t_{\text {d2 }}$ | Delay time, aperture |  | 5 |  | ns |
| $\mathrm{t}_{\text {conv }}$ | Conversion time |  |  | 2.2 | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {aca }}$ | Acquisition time | 1.8 |  |  | $\mu \mathrm{s}$ |

Figure 26. ADC Reset

## ADC RESET

The ADC reset function of the ADS8505 can be used to terminate the current conversion cycle. Bringing R/C low for at least 40 ns while BUSY is low will initiate the ADC reset. To initiate a new conversion, R/C must return to the high state and remain high long enough to acquire a new sample (see Table 3, $\mathrm{t}_{\mathrm{c}}$ ) before going low to initiate the next conversion sequence. In applications that do not monitor the BUSY signal, it is recommended that the ADC reset function be implemented as part of a system initialization sequence.

## INPUT RANGES

The ADS8505 offers a standard $\pm 10-\mathrm{V}$ input range. Figure 28 shows the necessary circuit connections for the ADS8505 with and without hardware trim. Offset and full-scale error specifications are tested and specified with the fixed resistors shown in Figure 28(b). Full-scale error includes offset and gain errors measured at both + FS and -FS. Adjustments for offset and gain are described in the CALIBRATION section of this data sheet.
Offset and gain are adjusted internally to allow external trimming with a single supply. The external resistors compensate for this adjustment and can be left out if the offset and gain are corrected in software (refer to the CALIBRATION section).
The nominal input impedance of $11.5 \mathrm{k} \Omega$ results from the combination of the internal resistor network shown on the front page of the product data sheet and the external resistors. The input resistor divider network provides inherent overvoltage protection assured to at least $\pm 25 \mathrm{~V}$. The $1 \%$ resistors used for the external circuitry do not compromise the accuracy or drift of the converter. They have little influence relative to the internal resistors, and tighter tolerances are not required.
The input signal must be referenced to AGND1. This minimizes the ground loop problem typical to analog designs. The analog signal should be driven by a low impedance source. A typical driving circuit using an OPA627 or OPA132 is shown in Figure 27.

Figure 27. Typical Driving Circuit ( $\pm 10$ V, No Trim)

## APPLICATION INFORMATION

## CALIBRATION

The ADS8505 can be trimmed in hardware or software. The offset should be trimmed before the gain since the offset directly affects the gain. To achieve optimum performance, several iterations may be required.

## Hardware Calibration

To calibrate the offset and gain of the ADS8505, install the proper resistors and potentiometers as shown in Figure 28(a).

## Software Calibration

To calibrate the offset and gain of the ADS8505 in software, no external resistors are required. See the No Calibration section for details on the effects of the external resistors.

## No Calibration

See Figure 28(b) for circuit connections. The external resistors shown in Figure 28(b) may not be necessary in some applications. These resistors provide compensation for an internal adjustment of the offset and gain which allows calibration with a single supply.

Note: Use 1\% metal film resistors.
Figure 28. Circuit Diagram With and Without External Resistors

## REFERENCE

The ADS8505 can operate with its internal $2.5-\mathrm{V}$ reference or an external reference. By applying an external reference to pin 5 , the internal reference can be bypassed. The reference voltage at REF is buffered internally with the output on CAP (pin 4).
The internal reference has an $8 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ drift (typical) and accounts for approximately $20 \%$ of the full-scale error ( $\mathrm{FSE}= \pm 0.5 \%$ ).

## REF

REF (pin 3) is an input for an external reference or the output for the internal $2.5-\mathrm{V}$ reference. A $2.2-\mu \mathrm{F}$ capacitor should be connected as close to the REF pin as possible. The capacitor and the output resistance of REF create a low-pass filter to bandlimit noise on the reference. Using a smaller value capacitor introduces more noise to the reference degrading the SNR and SINAD. The REF pin should not be used to drive external ac or dc loads.
The range for the external reference is 2.3 V to 2.7 V and determines the actual LSB size. Increasing the reference voltage increases the full-scale range and the LSB size of the converter which can improve the SNR.

## APPLICATION INFORMATION (continued)

## CAP

CAP (pin 4) is the output of the internal reference buffer. A $2.2-\mu \mathrm{F}$ capacitor can be placed between the CAP pin and ground. Because the internal reference buffer is internally compensated, the external capacitor is not necessary for compensation of the reference buffer. This relaxes the performance requirements of the capacitor and makes the performance of the ADC less sensitive to the capacitor.
The output of the buffer is capable of driving up to 2 mA of current to a dc load. A dc load requiring more than 2 mA of current from the CAP pin begins to degrade the linearity of the ADS8505. Using an external buffer allows the internal reference to be used for larger dc loads and ac loads. Do not attempt to directly drive an ac load with the output voltage on CAP. This causes performance degradation of the converter.

## LAYOUT

## POWER

For optimum performance, tie the analog and digital power pins to the same $+5-\mathrm{V}$ power supply and tie the analog and digital grounds together. As noted in the electrical specifications, the ADS8505 uses $90 \%$ of its power for the analog circuitry. The ADS8505 should be considered as an analog component.

The $+5-\mathrm{V}$ power for the $\mathrm{A} / \mathrm{D}$ should be separate from the +5 V used for the system's digital logic. Connecting $V_{\text {DIG }}$ (pin 28) directly to a digital supply can reduce converter performance due to switching noise from the digital logic. For best performance, the $+5-\mathrm{V}$ supply can be produced from whatever analog supply is used for the rest of the analog signal conditioning. If $+12-\mathrm{V}$ or $+15-\mathrm{V}$ supplies are present, a simple $+5-\mathrm{V}$ regulator can be used. Although it is not suggested, if the digital supply must be used to power the converter, be sure to properly filter the supply. Either using a filtered digital supply or a regulated analog supply, both $\mathrm{V}_{\text {DIG }}$ and $\mathrm{V}_{\text {ANA }}$ should be tied to the same $+5-\mathrm{V}$ source.

## GROUNDING

Three ground pins are present on the ADS8505. DGND is the digital supply ground. AGND2 is the analog supply ground. AGND1 is the ground which all analog signals internal to the A/D are referenced. AGND1 is more susceptible to current induced voltage drops and must have the path of least resistance back to the power supply.
All the ground pins of the A/D should be tied to the analog ground plane, separated from the system's digital logic ground, to achieve optimum performance. Both analog and digital ground planes should be tied to the system ground as near to the power supplies as possible. This helps to prevent dynamic digital ground currents from modulating the analog ground through a common impedance to power ground.

## SIGNAL CONDITIONING

The FET switches used for the sample/hold on many CMOS A/D converters release a significant amount of charge injection which can cause the driving op-amp to oscillate. The FET switch on the ADS8505, compared to the FET switches on other CMOS A/D converters, releases $5 \%$ to $10 \%$ of the charge. There is also a resistive front end which attenuates any charge which is released. The end result is a minimal requirement for the anti-alias filter on the front end. Any op-amp sufficient for the signal in an application is sufficient to drive the ADS8505.
The resistive front end of the ADS8505 also provides an assured $\pm 25$-V overvoltage protection. In most cases, this eliminates the need for external input protection circuitry.

## INTERMEDIATE LATCHES

The ADS8505 does have 3-state outputs for the parallel port, but intermediate latches should be used if the bus is to be active during conversions. If the bus is not active during conversion, the 3 -state outputs can be used to isolate the $A / D$ from other peripherals on the same bus. The 3 -state outputs can also be used when the $A / D$ is the only peripheral on the data bus.

Intermediate latches are beneficial on any monolithic A/D converter. The ADS8505 has an internal LSB size of $38 \mu \mathrm{~V}$. Transients from fast switching signals on the parallel port, even when the $\mathrm{A} / \mathrm{D}$ is 3 -stated, can be coupled through the substrate to the analog circuitry causing degradation of converter performance.

## Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

## Changes from Original (September, 2005) to A Revision <br> Page

- Added SFDR value ......................................................................................................................................................... 1 1
- Changed 3.0 to 1.5 Max INL[........................................................................................................................................... 11
- Changed 3.0 to 1.5 Minimum Relative Accuracy .............................................................................................................. 2
- Changed REF and CAP - reversed............................................................................................................................... 2
- Changed INL, SFDR, THD, SNR values ............................................................................................................................. 2
- Changed SFDR-TA, THD-TA, SINAD-TA, SNR-fi, SINAD-fi SFDR-fi, THD-fi, IDD-TA, CAP ESR, INL, DNL, and FFT curves6
- Changed CAP description ........................................................................................................................................... 16

Changes from A Revision (October, 2006) to B Revision
Page

- Deleted text from basic operation description …............................................................................................................... 8
- Changed text in starting a conversion description ........................................................................................................... 9

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined
Pb-Free (RoHS): Tl's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Pb -Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): Tl defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine ( Br ) and Antimony ( Sb ) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.
TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in Tl's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.
TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.
Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.
Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.
In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, Tl's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.
No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.
Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
