

UNISONIC TECHNOLOGIES CO., LTD

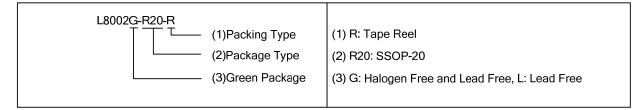

It generates the required negative voltage to bias the gate of GaAs FET, and internally provides protection circuit that can protect the FET devices during supply voltage transient. So it is very popular in satellite receiver front end block.

FEATURES

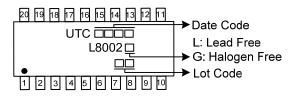

- * Built in FET device protection circuit
- * Stable bias control for GaAs and HEMT FETs
- * Drive up to six FETs
- * 2.5V supply voltage

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	VD1	1 st Drain output voltage
2	VG1	1 st Gate output voltage
3	VD2	2 nd Drain output voltage
4	VG2	2 nd Gate output voltage
5	VG3	3 rd Gate output voltage
6	VD3	3 rd Drain output voltage
7	GND	Ground
8	NC	No connect
9	CNB1	OSC output
10	CNB2	Rectifier Input
11	CSUB	Negative voltage output
12	NC	No connect
13	NC	No connect
14	VG6	6 th Gate output voltage
15	VD6	6 th Drain output voltage
16	VG5	5 th Gate output voltage
17	VD5	5 th Drain output voltage
18	VG4	4 th Gate output voltage
19	VD4	4 th Drain output voltage
20	V _{CC}	Supply voltage

■ ABSOLUTE MAXIMUM RATING

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	V _{CC}	-0.6 ~ 3	V
Supply Current	Icc	100	mA
Maximum Drain Current	I _D	15	mA
Maximum CSUB Sink Current	I _{CSUB}	-500	uA
Operating Temperature	T _{OPR}	-40 ~ +85	°C
Storage Temperature	T _{STG}	-50 ~ +125	°C

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

TYPICAL APPLICATION CIRCUIT

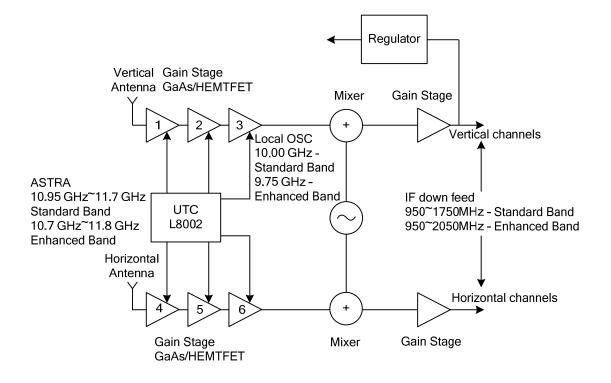

There are three major functions provided by UTC **L8002**: support negative voltage, bias control circuit, and FET protesting circuit.

The negative voltage is generated using internal oscillator. It only needs an ac coupled capacitor C_{NB} 47nF and a negative voltage bypass capacitor C_{SUB} 47nF.

The UTC **L8002** devices have been designed to protect the external FETs from adverse operating conditions. With a JFET connected to any bias circuit, the gate output voltage of the bias circuit can not exceed the range -2V to 0.7V, under any conditions including powerup and powerdown transients. Should the negative bias generator be shorted or overloaded so that the drain current of the external FETs can no longer be controlled, the drain supply to FETs is shut down to avoid damage to the FETs by excessive drain current. The following diagrams show the **L8002** in typical LNB applications. Within each FET gain stage the numbering system indicates how the bias stages relate to the application circuits.
