

# THCV226

V-by-One® HS High-speed Video Data Receiver

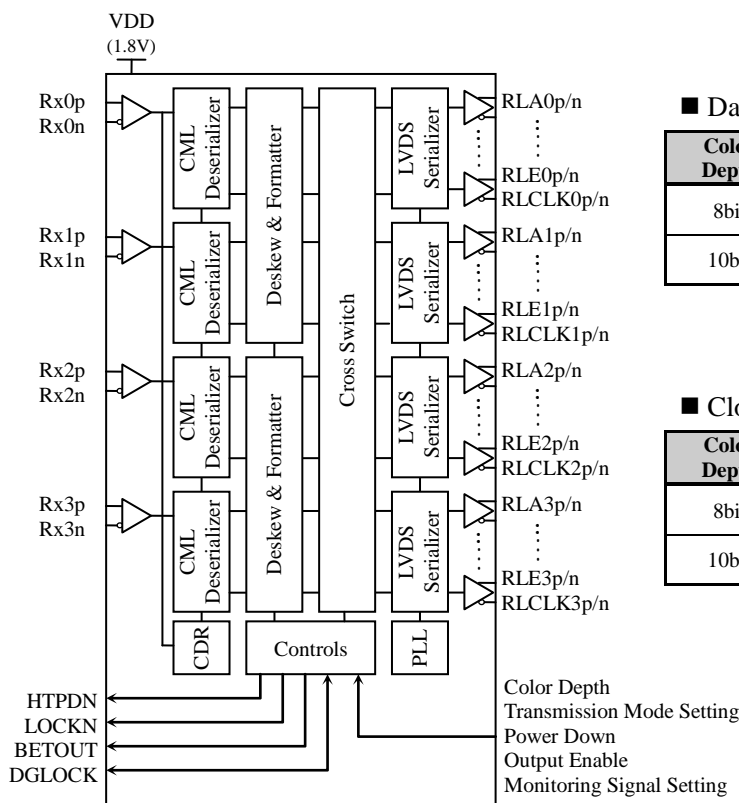

## General Description

THCV226 is designed to support video data transmission between the host and display. This chip can receive 32bit video data and 3bit control data via four differential pairs of V-by-One® HS lanes. This chip in TQFP package supports the video data transmission up to 1080p/10b/120Hz. The maximum serial data rate is 3.4Gbps/lane.

## Features

- Normal / High-speed LVDS output selectable
- 1.8V single power supply
- Color depth selectable: 8/10 bits per colors
- Crossing / Distribution mode selectable
- Monitoring signal function
- 1.8V LVTTTL I/O interface
- Package: 128pin 0.4mm-pitch TQFP (16mm x 16mm)
- Wide frequency range
- AC coupling for CML inputs
- CDR requires no external frequency reference
- Supports Spread Spectrum Clocking tolerance with up to 30kHz/±0.5%(center spread)
- V-by-One® HS standard compliant
- PLL requires no external components
- Power down / Output enable mode

## Block Diagram

■ Data Transmission Rate of CML Input

Color Depth	Normal Speed LVDS Mode	High-Speed LVDS Mode
8bit	1.2 to 2.7Gbps	1.2 to 2.36Gbps
10bit	1.6 to 3.4Gbps	1.6 to 3.14Gbps

■ Clock Frequency of LVDS Output

Color Depth	Normal Speed LVDS Mode	High-Speed LVDS Mode
8bit	40 to 90MHz	80 to 157MHz
10bit	40 to 85MHz	80 to 157MHz

**PIN Configuration**

## PIN Description

PIN Name	PIN No	Type	Description
Rx0n , Rx0p	107, 108	CI	CML Data Input

RLD3n , RLD3p	17, 16	LO	LVDS Data Output
RLE3n , RLE3p	15, 14	LO	LVDS Data Output
DGLOCK	101	BI	Connect all DGLOCK pins in multiple-chip configuration. Must be left OPEN for single-chip configuration
HTPDN	102	OD	Hot plug detect output Must be connected to Tx HTPDN with a 10K $\Omega$ pull-up resistor
LOCKN	103	OD	Lock detect output Must be connected to Tx LOCKN with a 10K $\Omega$ pull-up resistor
COL	88	I	Color depth select 1 : 10bit mode 0 : 8bit mode
OPF	89	I	Output Pattern at CDR Fail Condition (LOCKN=1) 1 : LVDS output Low data 0 : LVDS output Hi-Z data
MODE2,1,0	92,91,90	I	Input / Output mode select
OE	99	I	LVDS Output Enable 1 : Normal Operation 0 : Output Disable
BET_SEL1,0	123, 122	I	Monitoring pin select

BET_EN	125	I	Field-BET enable 1 : Enable 0 : Normal operation
BET_LAT	126	I	Latch select input under Field BET operation 1 : Latched result output 0 : Reset latched result
MON_EN	124	I	Monitoring mode enable 1 : Monitoring enable 0 : Monitoring disable
PRBS	3	I	Must be tied to GND or used for Monitoring Signal Function, refer to Table10.
RS	4	I	LVDS swing level select 1 : Normal swing (350mV) 0 : Reduced swing (200mV)
MAP	5	I	LVDS output format select 1 : JEIDA format 0 : VESA format
PDN	9	I	Power down 1 : Normal operation 0 : Power down operation
BETOUT	127	O	Field BET result output
Reserved 0,1,2,3,4,5	6, 7, 8, 93, 94, 95	I	Must be tied to GND
Reserved 6,7	97, 98	O	Must be open
CVDD	10, 30, 67, 86, 104, 121	PWR	1.8V power supply for Logic block
VVDD	106, 112, 119	PWR	1.8V power supply for V-by-One <sup>®</sup> HS block
LVDD	12, 18, 24, 32, 40, 58, 65, 73, 79, 85	PWR	1.8V power supply for LVDS block
PVDD	11	PWR	1.8V power supply for PLL block
LPVDD	46, 52	PWR	1.8V power supply for LVDS analog block
IOVDD	2, 100,	PWR	1.8V power supply for LVTTTL I/O buffer
GND	1, 13, 19, 25, 31, 39, 45, 51, 57, 66, 72, 78, 84, 87, 96, 105, 109, 113, 116, 120, 128	GND	Ground

CI : CML Input buffer , LO : LVDS Output buffer , BI : LVTTTL Bi-directional buffer

I : LVTTTL Input buffer , O : LVTTTL Output buffer , OD : Open Drain buffer

PWR : 1.8V Power supply , GND : Ground

## Functional Description

### Functional Overview

With V-by-One<sup>®</sup> HS's proprietary encoding scheme and CDR (Clock and Data Recovery) architecture, THCV226 enables the transmission of 8 or 10-bit video data, 2-bit synchronizing control data of HSYNC, VSYNC, and Data Enable(DE), by a pair cable with minimal external components.

THCV226 automatically extracts the clock from the incoming data streams and converts the serial data into video data with DE being high or synchronizing control data with DE being low, recognizing which type of serial data is being sent by the transmitter. Also, THCV226 outputs the recovered data in the LVDS data format.

THCV226 can operate for a wide range of a serial bit rate from 1.2Gbps to 3.4Gbps. It is unnecessary to use any external frequency reference, such as a crystal oscillator.

### Data Enable Requirement (DE)

There are some requirements for DE signal as described in Figure1 and Figure2.

If DE=Low, control data of same cycle and particular assigned data bit 'CTL' except the first and last pixel are transmitted. Otherwise video data is transmitted during DE=High.

Control data from source device in DE=High period is previous data of DE transition. See Figure2.

The length of DE being low and high must be at least 8 clock cycles long, as described in Figure17 and Table17.

DE must be toggled as High -> Low -> High at regular interval.

### CTL Bit Transmission

There is particular assigned data bit 'CTL' which can be transmitted at blanking period except the first and the last pixel on DE=Low.

000	1	40 – 85MHz	40 – 85MHz	Normal LVDS mode
	0	40 – 90MHz	40 – 90MHz	

Table 2. Transmission Mode Select

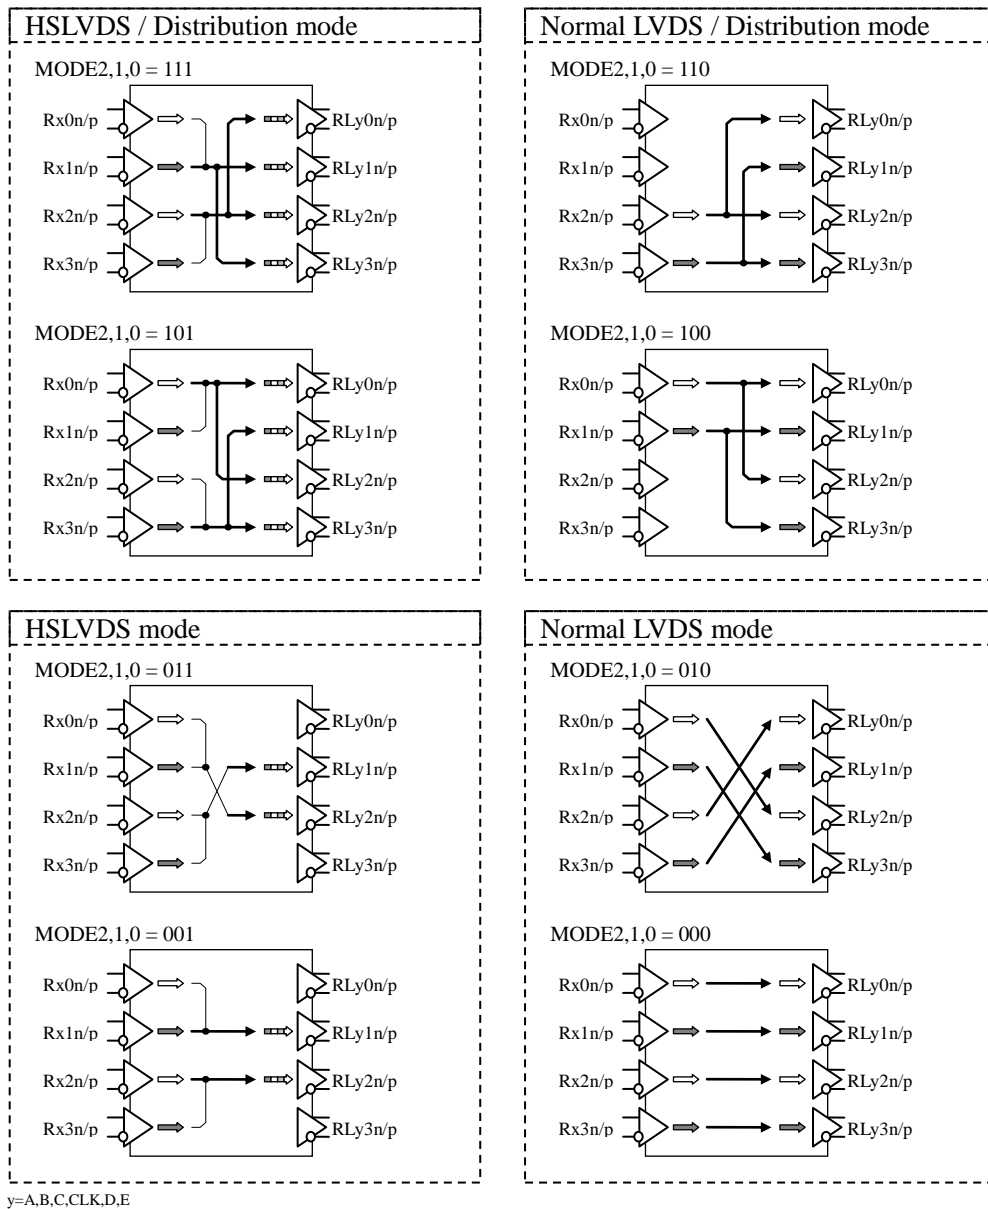

Figure 3. Transmission Mode Select Diagram

**Power Down Mode**

PDN	Operation
1	Normal operation
0	Power down operation

Table 3. Power Down Mode

**Hot-plug and Lock Detect Function**

HTPDN and LOCKN are both open drain outputs from THCV226. Pull-up resistors must be placed at V-by-One® HS transmitter side. See Figure.4 and 5.

If THCV226 is not active (power down mode (PDN=0) or powered off), HTPDN is open. Otherwise, HTPDN is pulled down by THCV226.

HTPDN at V-by-One® HS transmitter side is High when THCV226 is not active or the receiver board is not connected. Then V-by-One® HS transmitter side enters into the power down mode. When HTPDN transits from High to Low, V-by-One® HS transmitter starts up and transmits training pattern for link training.

LOCKN indicates whether THCV226 is in CDR state or not. If THCV226 is in the CDR unlock state, LOCKN is open. Otherwise (in the CDR lock state), it is pulled down by THCV226.

V-by-One® HS transmitter side keeps transmitting training pattern until LOCKN transition to Low. After training is done, THCV226 sinks current, and LOCKN turns to Low. Then V-by-One® HS transmitter side starts transmitting normal video pattern.

Figure 4. HTPDN and LOCKN Scheme

Figure 5. HTPDN and LOCKN Scheme without HTPDN Connection

### Multiple-chip Configuration

In order to reduce the number of cables needed for HTPDN and LOCKN in multiple-chip configuration, THCV226 is equipped with the DGLOCK pin. When all the DGLOCK pins are connected as in Figure 6, the connected Rx chips can share the CDR lock status via DGLOCK, making all the Rx chips in the same operation status.

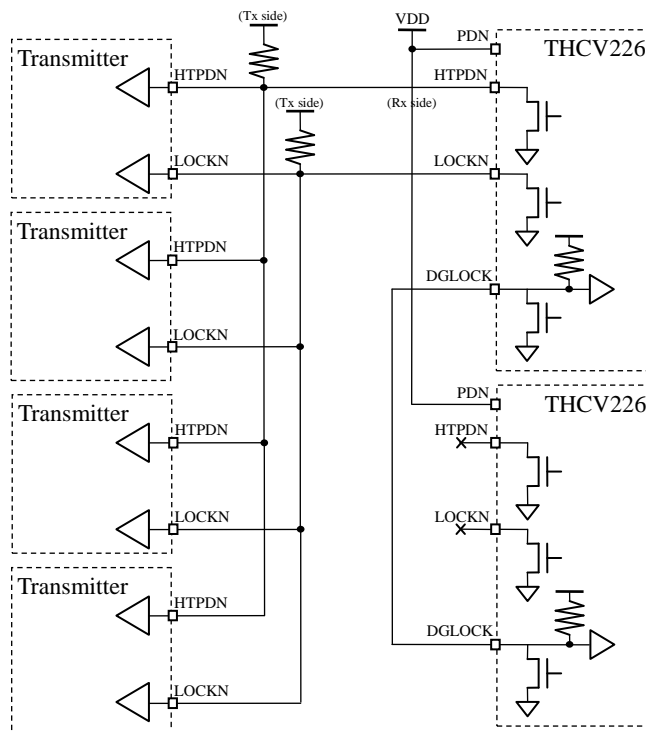

Figure 6. Usage of DGLOCK in Multiple-Rx Configuration

### Field BET Operation

In order to help to debug high-speed serial links of CML lines, THCV226 has an operation mode acted as the bit error tester (Field BET). In the Field BET mode, the on-chip pattern generator on V-by-One<sup>®</sup> HS transmitter side is enabled and generates a test pattern. THCV217, which is an example of Tx device, has this function mode. In this mode, THCV217 internally generates the test pattern, encodes the data according to the 8b10b protocol, scrambles, and then serializes onto the CML high-speed lines.

THCV226 receives the data stream and checks whether the sampled data has bit error.

“Field BET” mode of THCV226 is activated by setting BET\_EN=1.

As for THCV226, when the internal test pattern check circuit is enabled, the pattern check result can be monitored at the BETOUT pin. The BETOUT pin goes Low whenever bit errors occur and stays High when there is no bit error. Please refer to Figure 7 and Figure 8.

Table 5 shows possible combination of Tx and Rx for normal and Field BET operation.

BETOUT	Result
L	Bit error occurred
H	No error

Table 4. Field BET Result

THCV217	THCV226				Condition	
	BET_EN	BET_LAT	BET_SEL1	BET_SEL0	Operation	Output Latch Select
0	0	0	-	-	Normal Operation	-
		1	-	-	Forbidden	-
0	1	-	-	-	Forbidden	-
1	0	-	-	-	Forbidden	-
1	1	0	0	0	Field BET Operation (Lane0)	Reset latched result
		1				Latched result
		0	0	1	Field BET Operation (Lane1)	Reset latched result
		1				Latched result
		0	1	0	Field BET Operation (Lane2)	Reset latched result
		1				Latched result
		0	1	1	Field BET Operation (Lane3)	Reset latched result
		1				Latched result

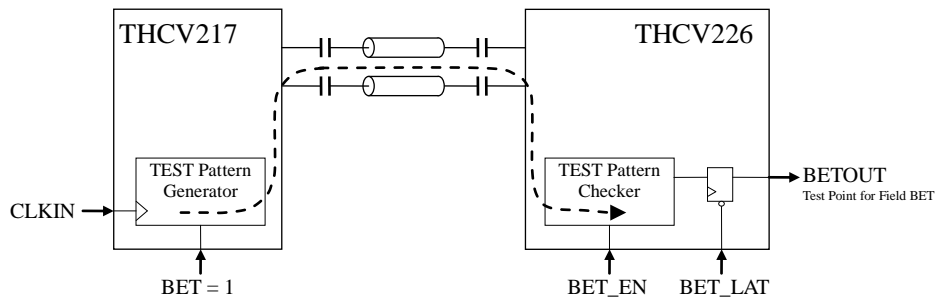

Figure 7. Field BET Configuration

Figure 8. Relationship between Bit Error and BETOUT

**LVDS Reduced Swing Output Function**

RS pin controls LVDS output swing level.

RS	Output Swing Level
0	Reduced Swing Level ( 200mV typical )
1	Normal Swing Level ( 350mV typical )

Table 6. LVDS Output Level Select

### LVDS Output Enable Function

By setting the OE and OPF pins, the following output enable function can be selected.

In output disable condition, all the outputs take low fixed data or High-Z except for HTPDN, LOCKN and DGLOCK.

LOCKN	OE	OPF	LVDS Outputs	
			Status	Output Condition
H	1	1	Output Enable	Low Fixed Data
		0		Hi-Z
	0	1	Output Disable	Low Fixed Data
		0		Hi-Z
L	1	1	Output Enable	Normal Data
		0		Low Fixed Data
	0	1	Output Disable	Low Fixed Data
		0		Hi-Z

Table 7. LVDS Output Enable Function

### LVDS Data Mapping

LVDS data (video data, control data, DE) are mapped as Figure 9. RLC[6] is special bit for DE (data enable). RLC[5:4] are for control data bits, and the other bits are for video data. Also there are special assigned bits, 'CTL' transmitted under DE=0 condition.

The number of LVDS channels depends on color depth mode, COL.

RLD[6] is not available at COL=0, 8-bit color depth mode.

**Monitoring Signal Function**

The recovered HSYNC, VSYNC, DE or CLK from V-by-One® HS signals can be monitored by “Monitoring Signal Function”. The monitoring lane out of four high-speed data lane is selectable. This function is used for debugging purpose and set by five pins, MON\_EN, BET\_SEL1, BET\_SEL0, BET\_LAT and PRBS.

The monitoring signal is outputted from BETOUT pin as 1.8V LVTTTL signal.

All signals operate as normal mode except these setting pins and monitoring output pin when “Monitoring Signal Function” is enabled. See the table below.

Function	Pin Option				Monitoring Output	Description	
	Lane Selection		Signal Selection				
MON_EN	BET_SEL1	BET_SEL0	BET_LAT	PRBS	BETOUT		
0	BET_SEL1	BET_SEL0	BET_LAT	0	BETOUT	Normal mode	
1	0	0	0	0	DE	Monitoring Signal Mode to Check Lane0

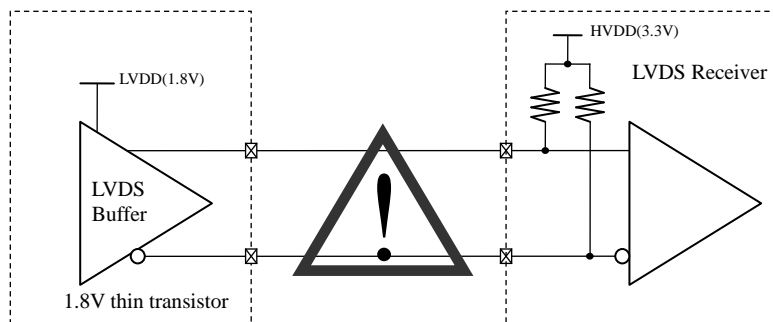

Figure 17. DE Period Requirement

**Note**

**1) LVDS Output Pin Connection**

In case that the LVDS Rx of destination device is equipped with pull-up resistors connected to higher than THCV226's VDD voltage, this can cause violation of absolute maximum ratings to THCV226. This phenomenon may be happened at power-on phase and Hi-Z state of the whole system including LVDS Rx device.

One solution for this problem is power-down control for LVDS Rx device during no LVDS input or Hi-Z state period, if its pull-up resistors can be cut off at power-down state. Another solution is to set THCV226's OPF option pin to VDD. This setting provides low fixed data output mode at PDN=1, not Hi-Z state mode.

**2) Cable Connection and Disconnection**

Do not connect and disconnect the LVDS and CML cables, when the power is supplied to the system.

**3) GND Connection**

Connect the each GND of the PCB which Transmitter and Receiver. It is better for EMI reduction to place GND cables as close to LVDS and CML cables as possible.

**4) Multi-drop Connect**

Multi-drop connect is not recommended.

**5) Multiple Counterpart Use**

Multiple counterpart use such as the following system is not recommended. If it is not avoidable, please check whether tRISK and tRIJT spec of THCV226 can be kept or not. Furthermore, please contact to

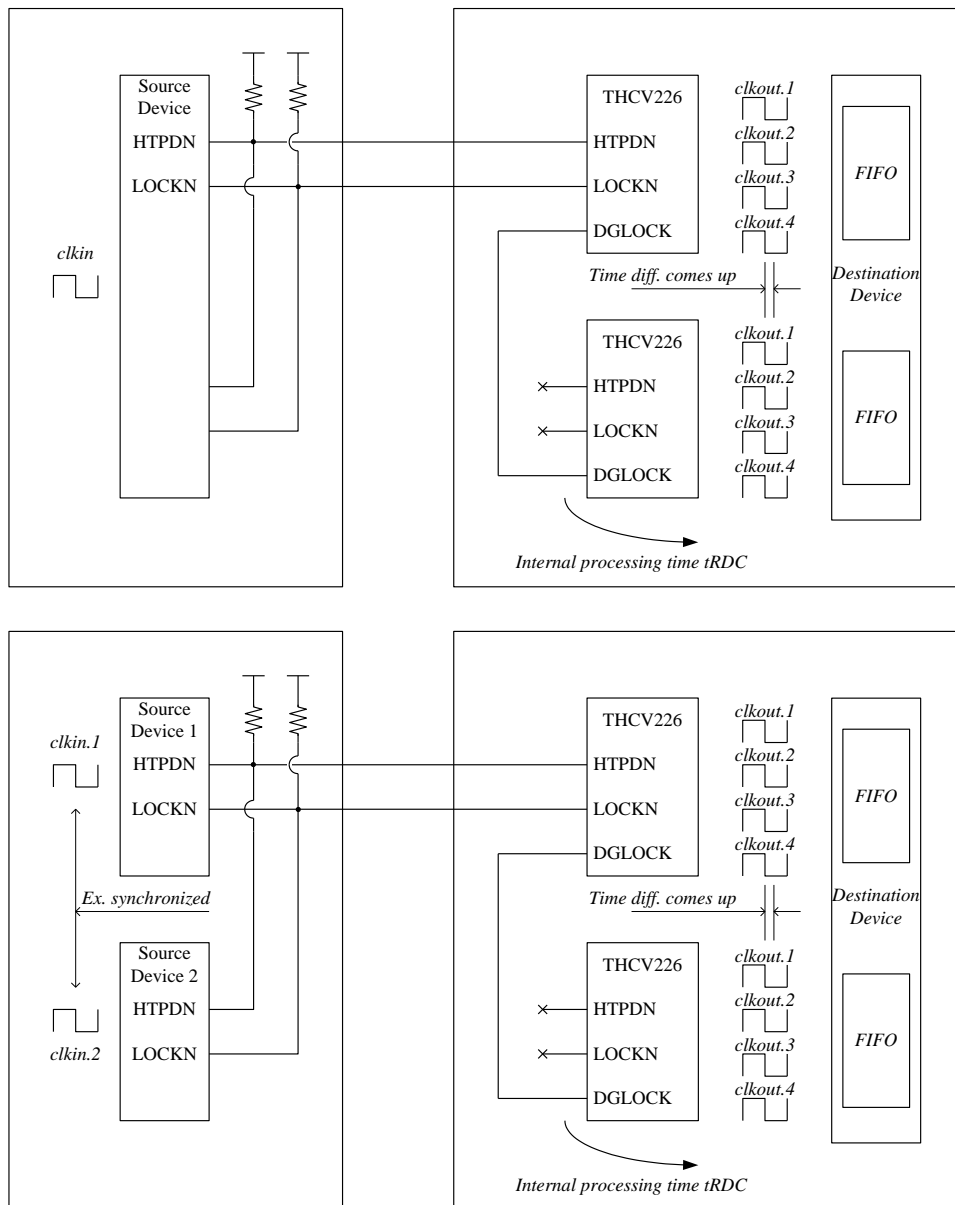

mssupport@thine.co.jp (for FAE mailing list)

**6) Multiple Device Connection**

HTPDN and LOCKN signals are supposed to be connected properly for their purpose like the following figure. HTPDN should be from just one THCv226 to multiple Tx devices because its purpose is only ignition of all Tx devices. LOCKN should be connected so as to indicate that CDR status of all Rx devices becomes ready to receive normal operation data. LOCKN of Tx side can be simply split to multiple Tx devices. THCv226's DGLOCK is appropriate for multiple Rx use.

Also possible time difference of internal processing time (THCV226 tRDC) on multiple data stream must be accommodated and compensated by the following destination device connected to multiple THCv226s, which may have internal FIFO.

## **Notices and Requests**

1. The product specifications described in this material are subject to change without prior notice.
2. The circuit diagrams described in this material are examples of the application which may not always apply to the customer's design. We are not responsible for possible errors and omissions in this material. Please note if errors or omissions should be found in this material, we may not be able to correct them immediately.
3. This material contains our copyright, know-how or other proprietary. Copying or disclosing to third parties the contents of this material without our prior permission is prohibited.
4. Note that if infringement of any third party's industrial ownership should occur by using this product, we will be exempted from the responsibility unless it directly relates to the production process or functions of the product.
5. Product Application
  - 5.1 Application of this product is intended for and limited to the following applications: audio-video device, office automation device, communication device, consumer electronics, smartphone, feature phone, and amusement machine device. This product must not be used for applications that require extremely high-reliability/safety such as aerospace device, traffic device, transportation device, nuclear power control device, combustion chamber device, medical device related to critical care, or any kind of safety device.
  - 5.2 This product is not intended to be used as an automotive part, unless the product is specified as a product conforming to the demands and specifications of ISO/TS16949 ("the Specified Product") in this data sheet. THine Electronics, Inc. ("THine") accepts no liability whatsoever for any product other than the Specified Product for it not conforming to the aforementioned demands and specifications.
  - 5.3 THine accepts liability for demands and specifications of the Specified Product only to the extent that the user and THine have been previously and explicitly agreed to each other.
6. Despite our utmost efforts to improve the quality and reliability of the product, faults will occur with a certain small probability, which is inevitable to a semi-conductor product. Therefore, you are encouraged to have sufficiently redundant or error preventive design applied to the use of the product so as not to have our product cause any social or public damage.
7. Please note that this product is not designed to be radiation-proof.
8. Testing and other quality control techniques are used to this product to the extent THine deems necessary to support warranty for performance of this product. Except where mandated by applicable law or deemed necessary by THine based on the user's request, testing of all functions and performance of the product is not necessarily performed.
9. Customers are asked, if required, to judge by themselves if this product falls under the category of strategic goods under the Foreign Exchange and Foreign Trade Control Law.
10. The product or peripheral parts may be damaged by a surge in voltage over the absolute maximum ratings or malfunction, if pins of the product are shorted by such as foreign substance. The damages may cause a smoking and ignition. Therefore, you are encouraged to implement safety measures by adding protection devices, such as fuses.
