

IA80C152

Preliminary Data Sheet

**UNIVERSAL COMMUNICATIONS CONTROLLER****FEATURES**

- **Form, Fit, and Function Compatible with the Intel<sup>®</sup> 80C152**
- **Packaging options available**
  - 48 Pin Plastic or Ceramic DIP
  - 68 Pin Plastic or Ceramic LCC
- **8051 Core with:**
  - Direct Memory Access(DMA)
  - Global Serial Channel (GSC)
  - MCS<sup>®</sup> - 51 Compatible UART
  - Two Timers/Counters
  - Maskable Interrupts
- **Memory**
  - 256 Bytes Internal RAM
  - 64K Bytes Program Memory
  - 64K Bytes Data Memory
- **5 or 7 I/O Ports**
- **Up to 16.5 MHz Clock Frequency**
- **Two-Channel DMA With Multiple Transfer Modes**
- **GSC Provides Support for Multiple Protocols**
  - CSMA/CD
  - SDLC/HDLC
  - User Definable
- **Separate Transmit & Receive FIFOs**
- **Special Protocol Features**
  - Up to 2.0625 Mbps Serial Operation
  - CSMA and SDLC Frame Formats with CRC Checking
  - Manchester, NRZ, & NRZI Data Encoding
  - Collision Detection & Resolution in CSMA Mode
  - Selectable Full/Half Duplex

## UNIVERSAL COMMUNICATIONS CONTROLLER

The IA80C152 is a "plug-and-play" drop-in replacement for the original IC. **innovASIC** produces replacement ICs using its MILES™, or Managed IC Lifetime Extension System, cloning technology. This technology produces replacement ICs far more complex than "emulation" while ensuring they are compatible with the original IC. MILES™ captures the design of a clone so it can be produced even as silicon technology advances. MILES™ also verifies the clone against the original IC so that even the "undocumented features" are duplicated. This data sheet documents all necessary engineering information about the IA80C152 including functional and I/O descriptions, electrical characteristics, and applicable timing.

INTEL is a registered trademark of Intel Corporation

### DESCRIPTION

The IA80C152 is a Universal Communications Controller (UCC) that is pin-for-pin compatible with the Intel™ 80C152. This version of the UCC is a ROMless version. The ROM version is identified as the 83C152 and can be easily derived from the 80C152 using a customer furnished ROM program. The IA80C152 can be programmed with the same software development tools and can transmit and receive using the same communication protocols as the Intel™ 80C152 making the IA80C152 a drop-in replacement. Table 1 below cross-references IA80C152 versions with protocol, package, and I/O Port capability. Pinout diagrams are provided in figures 1, 2, and 3.

<b>innovASIC Part Number</b>	<b>CSMA/CD, SDLC/HDLC, User-Defined</b>	<b>5 I/O Ports</b>	<b>7 I/O Ports</b>	<b>48 Pin DIP</b>	<b>68 Lead LCC</b>
IA80C152JA	√	√		√	√
IA80C152JB	√		√		√
IA80C152JC	√	√		√	√
IA80C152JD	√		√		√

The only difference between The **innovASIC** 80C152 and the Intel™ 80C152 is that all protocols are available in all IC versions. Originally, the Intel™ 80C152 JC and JD versions were limited to SDLC/HDLC only. Also, **innovASIC** will support a ROM version (83152) in any of the JA, JB, JC, or JD versions.

The IA80C152 is partitioned into three major functional units identified as the C8051, the Direct Memory Access (DMA) Controller, and the Global Serial Channel (GSC). The C8051 is implemented using a CAST, Inc. Intellectual Property (IP) core. This core is instruction set compatible with the 80C51BH, and contains compatible peripherals including a UART interface and timers. The special function registers (SFRs) and interrupts are modified from the original 8051BH to accommodate the additional DMA controller and GSC peripherals.

The DMA Controller is a 2 channel, 8-bit device that is 16-bit addressable. Either channel can access any combination of reads and writes to external memory, internal memory, or the SFR's. Various modes allow the DMA to access the UART, GSC, SFRs, and internal and external memory as well as provide for external control. Since there is only 1 data/program memory bus, only one DMA channel or the microcontroller can have control at any give time. Arbitration within the device makes this control transparent to the programmer.

**UNIVERSAL COMMUNICATIONS CONTROLLER**

The GSC is a serial interface that can be programmed to support CSMA/CD, SDLC, user definable protocols, and limited HDLC. Protocol specific features are supported in hardware such as address recognition, collision resolution, CRC generation and errors, automatic re-transmission, and hardware acknowledge. The CSMA/CD protocol meets the requirements of ISO/IEC 8802-3 and ANSI/IEEE Std 802.3 to the extent implemented in the original IC. The SDLC protocol meets the requirements of IBM GA27-3093-04 to the extent implemented in the original IC.

**Functional Block Diagram**

Figure 4 shows the major functional blocks of the IA80C152. Each version of the IA80C152 function identically to each other with the exception of the 2 additional I/O ports (Port 5 and Port 6) in the JB and JD versions.

**Figure 4 - Functional Block Diagram**

## UNIVERSAL COMMUNICATIONS CONTROLLER

### I/O Signal Description

Table 2 below describes the I/O characteristics for each signal on the IC. The signal names correspond to the signal names on the pinout diagrams provided above. (!) Denotes active Low.

Table 2 - I/O Signal Descriptions	
Signal Name	Description
!EA	External Access enable. Since there is no internal ROM in the 80C152, this signal has no function in the JA and JC versions. For the JB and JD versions, controls program memory fetch locations.
!EPSEN	E-bus Program Store ENable. When EBEN is 1, this signal is the read strobe for external program memory.
!PSEN	Program Store ENable. When EBEN is 0, this signal is the read strobe for external program memory.
!RESET	Reset. When this signal is low for 3 machine cycles, the device is put into reset. The GSC may continue transmitting after reset is applied. An internal pull-up allow the use of an external capacitor to generate a power-on reset.
ALE	Address Latch Enable. Latches the low-byte of external memory.
EBEN	E-Bus ENable. In conjunction with EA, EBEN designates program memory fetches from either Port 0,2 or Port 5,6.
P0.0 P0.1 P0.2 P0.3 P0.4 P0.5 P0.6 P0.7	Port 0 - open drain 8-bit bi-directional port that bit addressable and can drive up to 8 LS TTL inputs. The port signals can be used as high impedance inputs.  This port also provides the low-byte of the multiplexed address and data bus depending on the state of !EBEN.
P1.0 - GRXD, GSC Receive P1.1 - GTXD, GSC Transmit P1.2 - !DEN, Driver Enable P1.3 - !TXC, External Transmit Clock P1.4 - !RXC, External Receive Clock P1.5 - !HLD, DMA Hold P1.6 - !HLDA, DMA Hold Acknowledge P1.7	Port 1 - 8-bit bi-directional port that is bit addressable. To use a port signal as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To use a port signal as an output, a 1 or 0 written to the port location is presented at the output.  Port signals in this port also serve as I/O for 80C152 functions. These I/O signals are defined next to the port name.
P2.0 P2.1 P2.2 P2.3 P2.4 P2.5 P2.6 P2.7	Port 2 - 8-bit bi-directional port that is bit addressable. To use a port signal as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To use a port signal as an output, a 1 or 0 written to the port location is presented at the output.  This port also provides the high-byte of the multiplexed address and data bus depending on the state of !EBEN.
P3.0 - RXD, UART Receive P3.1 - TXD, UART Transmit P3.2 - !INT0, External Interrupt 0 P3.3 - !INT1, External Interrupt 1 P3.4 - T0, Timer 0 External Input P3.5 - T1, Timer 1 External Input P3.6 - !WR, External Data Memory Write Strobe P3.7 - !RD, External Data Memory Read Strobe	Port 3 - 8-bit bi-directional port that is bit addressable. To use a port signal as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To use a port signal as an output, a 1 or 0 written to the port location is presented at the output.  Port signals in this port also serve as I/O for 80C152 functions. These I/O signals are defined next to the port name.
P4.0 P4.1 P4.2	Port 4 - 8-bit bi-directional port that is bit addressable. To use a port signal as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To

## UNIVERSAL COMMUNICATIONS CONTROLLER

Table 2 - I/O Signal Descriptions

Signal Name	Description
P4.3 P4.4 P4.5 P4.6 P4.7	use a port signal as an output, a 1 or 0 written to the port location is presented at the output.
P5.0 P5.1 P5.2 P5.3 P5.4 P5.5 P5.6 P5.7	Port 5 - 8-bit bi-directional port that is NOT bit addressable. To use the port as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To use the port as an output, 1s or 0s written to the port are presented at the output.  This port also provides the low-byte of the multiplexed address and data bus depending on the state of !EBEN.
P6.0 P6.1 P6.2 P6.3 P6.4 P6.5 P6.6 P6.7	Port 6 - 8-bit bi-directional port that is NOT bit addressable. To use the port as an input, write a 1 to the port location. Internal pull-ups pull the input high and source current when the input is driven low. To use the port as an output, 1s or 0s written to the port are presented at the output.  This port also provides the high-byte of the multiplexed address and data bus depending on the state of !EBEN.
VCC	Supply Voltage
VSS	Device Ground
XTAL1	Input to the internal clock generator
XTAL2	Output from the internal oscillator amplifier

## Memory Space

Memory space is divided up into program and data memory. Program memory is all external to the IA80C152. Data memory is divided up into external and internal data memory. There can be up to 64K bytes of external program and data memory. Internal data memory is 256 bytes that is mapped between RAM, SFRs, and Register Banks. Figure 5 diagrams the organization of the IA80C152 memory space. See the C8051 section for further details.

Program memory is accessed using control signals and ports. On the JA and JC versions of the IA80C152 this access is performed through ports P0 and P2. Further, since there is no internal ROM, the entire program memory space is accessed via ports P0 and P2. On the JB and JD version of the IA80C152, program memory access can be through either ports P0 and P2, or ports P5 and P6. Which set of ports program memory fetches are made is controlled by the input signals !EA and !EBEN. Table 3 summarizes the IA80C152 versions and the relationship to program memory fetches.

# UNIVERSAL COMMUNICATIONS CONTROLLER

**Figure 5 - Memory Space**

Table 3 - Summary of Program Memory Fetches						
Version	Fetch Control		Fetch Ports	Fetch Signal		Memory Space
	EBEN	EA		PSEN	EPSEN	
JA, JC	N/A	0 or 1	P0, P2	Active	-	0h - FFFFh
JB, JD	0	0	P0, P2	Active	-	0h - FFFFh
	1	0	P5, P6	-	Active	0h - FFFFh
	1	1	P5, P6	-	Active	0h - 1FFFh
			P0, P2	Active	-	2000h - FFFFh

## Summary of the 80C152 Registers and Interrupts

The 80C152 combines the register set of the 8051BH and additional SFRs for the DMA and GSC functions. Likewise, the 80C152 combines the interrupts of the 8051BH and the interrupts required by the DMA and GSC. Table 4 contains a summary of the 80C152 registers, and table 5 contains a summary of the 80C152 interrupts.

## Power Conservation Modes

There are 2 power conservation modes identified as Idle Mode and Power Down Mode. The IA80C152 pins will have values according to the Table 6 below.

Idle Mode is entered through software control of the PCON register. Idle halts processor execution and the DMA. The GSC continue to operate to the extent that it can without the processor or DMA servicing its requests. Idle mode is exited upon receipt of any enabled interrupt or invoking a hardware reset.

Power Down Mode is entered through software control of the PCON register. Power Down disables the oscillator causing all functions to stop. RAM data is maintained since power is not removed from the device. The only way to exit power down mode is to invoke a hardware reset.

**UNIVERSAL COMMUNICATIONS CONTROLLER****Table 6 - Power Conservation Modes**

Mode	Program Fetch	ALE	PSEN	EPSEN*	Port 0	Port 1	Port 2	Port 3	Port 4	Port 5*	Port 6*
Idle	P0, P2	1	1	1	Float	Data	Addr.	Data	Data	0FFh	0FFh
	P5, P6*	1	1	1	Data	Data	Data	Data	Data	0FFh	Addr.
Power Down	P0, P2	0	0	1	Float	Data	Data	Data	Data	0FFh	0FFh
	P5, P6*	0	1	0	Data	Data	Data	Data	Data	0FFh	0FFh

\*JB and JD Versions Only

**Oscillator Pins**

There are 2 methods for providing a clock to the 80C152. One method is to provide a crystal oscillator and the other method is to provide an external clock source. When providing a crystal oscillator, the XTAL1 pin is the input and XTAL2 is the output. The min and max crystal frequencies are 3.5 MHz and 16.5 MHz, respectively.

When providing an external clock source, XTAL1 is the input and XTAL has no connection. Duty cycle does not matter to the device, however, the external clock source requires a minimum pulse width of 20 ns.

**Summary of the 8051 Instruction Set**

Table 7 provides a summary of the instruction set organized by hexadecimal opcode. Please refer to the original Intel™ Data Book for individual instruction set details.

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

**80C152 Register Set Descriptions**

The following are detailed descriptions for the IA80C152 register set. This register set is the same for all versions of the IA80C152. There is no difference between the IA80C152 register set and the register set for the original device.

In addition to the registers listed below, there are four banks of eight general purpose registers (R0 through R7) which reside within internal RAM space. Selection of these register banks is controlled through the Program Status Word (PSW).

The register descriptions are listed in alphanumeric order. The asterisk (\*) indicates the register is bit addressable.

**A\* (0E0h)** - Accumulator register used for various memory, arithmetic, and logic operations.

**ADR0,1,2,3 (095h, 0A5h, 0B5h, 0c5h)** - Address match registers contain the values which determine which data will be accepted as valid. If using 8 bit addressing mode a match with any of the four registers will cause the data to be accepted. If using 16 bit addressing mode a match with the pairs ADR1 and ADR2 or ADR3 and ADR2 will cause the data to be accepted. A received address of all 1s will be accepted regardless of whether the address mode is 16 bit or 8 bit.

**B\* (0F0h)** - B register used for multiply and divide instructions. May also be used as a general purpose register.

**AMSK0,1 (0D5h, 0E5h)** - Address Match Mask registers are used to set the corresponding bit in Address match registers to don't care. Setting the bit to a one in the AMSK register sets the corresponding bit in the ADR register to don't care.

**BAUD (094h)** - Contains the value to be used by the baud rate determining equation. The value written to BAUD will actually be stored in a reload register. When the BAUD register contents are decremented to 00H the BAUD register will be reloaded from the reload register. Reading the BAUD register yields the current baud rate timer value. A read during a GSC operation may not give the current value since the value in BAUD could decrement after it is read and before the read value can be stored in its destination.

**BCRL0, BCRH0 (0E2h, 0E3h)** - Byte count register high and low bytes for DMA channel 0. The two registers provide a 16-bit value representing for the number of DMA transfers via channel 0. Valid count range is from 0 to 65535.

**BCRL0, BCRH0 (0F2h, 0F3h)** - Byte count register high and low bytes for DMA channel 1. The two registers provide a 16-bit value representing for the number of DMA transfers via channel 1. Valid count range is from 0 to 65535.

**BKOFF (0C4h)** - An 8 bit count down timer with a clock period equal to one slot time. A user may read the register, but the register is clocked asynchronously to the CPU so invalid data can result. Writing to BKOFF will have no effect.

**DARL0, DARH0 (0C2h, 0C3h)** - Destination address register high and low bytes for DMA channel 0. The two registers provide a 16-bit value representing the address of the destination for a DMA transfer via channel 0. Valid address range is from 0 to 65535.

**DARL0, DARH0 (0D2h, 0D3h)** - Destination address register high and low bytes for DMA channel 1. The two registers provide a 16-bit value representing the address of the destination for a DMA transfer via channel 1. Valid address range is from 0 to 65535.

**DCON0,1 (092h, 093h)** - DCON0 and DCON1 control DMA channel 0 or 1, respectively. Each bit in these 8-bit registers control the DMA transfer as described below.

7	6	5	4	3	2	1	0
DAS	IDA	SAS	ISA	DM	TM	DONE	GO

DAS - This bit in conjunction with IDA determine the destination address space.

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

*IDA* - If *IDA* is set to 1 then the destination address is automatically incremented after the transfer of each byte.

<i>DAS</i>	<i>IDA</i>	Destination	Auto-Increment
0	0	External Ram	NO
0	1	External Ram	YES
1	0	SFR	NO
1	1	Internal RAM	YES

*SAS* - This bit in conjunction with *ISA* determine the source address space.

*ISA* - If *ISA* is set to 1 then the source address is automatically incremented after the transfer of each byte.

<i>SAS</i>	<i>ISA</i>	Source	Auto-Increment
0	0	External Ram	NO
0	1	External Ram	YES
1	0	SFR	NO
1	1	Internal RAM	YES

*DM* - If this bit is set to a 1 then the DMA channel operates in demand mode. In this mode the DMA is initiated by either an external signal or by a serial port flag depending on the value of the *TM* bit. If the *DM* bit is set to a 0 then DMA is initiated by setting the *GO* bit.

*TM* - If *DM* is 1 then *TM* selects if DMA is initiated by an external signal (*TM*=1) or by a serial port bit (*TM*=0). If *DM* is 0 then *TM* selects whether DMA transfers are in burst mode (*TM*=1) or in alternate cycles mode (*TM*=0).

<i>DM</i>	<i>TM</i>	Mode
0	0	Alternate Cycles
0	1	Burst
1	0	Serial Port Demand
1	1	External Demand

*DONE* - This bit indicates that the DMA operation has completed. It also causes an interrupt. This bit is set to 1 when *BCRn* equals 0 and is set to 0 when the interrupt is vectored to. The user can also set and clear this bit.

*GO* - If this bit is set to 1 it enables the DMA channel.

**DPL, DPH (082h, 083h)** - *DPTR*, or the "data pointer" consists of the two 8-bit registers, *DPL* and *DPH*. The *DPTR* must be used for accesses to external memory requiring 16-bit addresses.

**GMOD (084h)** - An 8-bit register that controls the GSC Modes as described below.

7	6	5	4	3	2	1	0
<i>XTCLK</i>	<i>M1</i>	<i>M0</i>	<i>AL</i>	<i>CT</i>	<i>PL1</i>	<i>PL0</i>	<i>PR</i>

*PR* - If set to a 1 the GSC is in SDLC mode. If set to a 0 the GSC is in CSMA/CD mode.

*PL0,1* - Preamble length:

<i>PL1</i>	<i>PL0</i>	Preamble length in bits
0	0	0
0	1	8
1	0	32
1	1	64

The length noted in the table includes the two bit BOF in CSMA/CD mode but not the SDLC flag. Zero length preamble is not compatible with CSMA/CD mode.

*CT* - This bit determines the CRC type used. If set to a 1 the 32 bit AUTODIN II-32 is used. If set to a 0 the 16 bit

# IA80C152 Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

---

CRC-CCITT is used.

*AL* - This bit determines the address length used. If set to a 1 the 16 bit addressing is used. If set to a 0 the 8 bit addressing is used.

*M1, M0* - These bits contain the backoff mode select bits as defined in the following table.

<i>M1</i>	<i>M0</i>	Mode
0	0	Normal
0	1	Raw Transmit
1	0	Raw Receive
1	1	Alternate Backoff

In Raw Receive mode the transmitter operates normally. The receiver operates normally except that all the bytes following the BOF are loaded into the receive FIFO including the CRC.

In the Raw Transmit mode the receiver operates as normal and zero bit detection is performed. The transmit output is driven from the receiver input. Data transmitted is done so without a preamble, flag or zero bit insertion and without a CRC.

In the Alternate Backoff mode the backoff is modified so it is delayed until the end of the IFS. Since the IFS time is generally longer than the slot time this should help to prevent collisions.

*XTCLK* - This bit enables the use of an external transmit clock. A 1 enables the external clock (input on port 1, bit 3), a zero enables the internal baud rate generator.

**IE\* (0A8h)** - The Interrupt Enable register allows the software to select which interrupts are enabled per the table below. If a bit is 0, the interrupt is disabled. If a bit is 1, the interrupt is enabled.

7	6	5	4	3	2	1	0
<i>EA</i>	-	-	<i>ES</i>	<i>ET1</i>	<i>EX1</i>	<i>ET0</i>	<i>EX0</i>

*EA* - Enable All interrupts. This bit globally enables or disables all interrupts regardless of the state of the individual bits.

*ES* - Enable or disable serial port interrupt.

*ET1* - Enable or disable Timer 1 overflow interrupt.

*EX1* - Enable or disable External Interrupt 1.

*ET0* - Enable or disable Timer 0 overflow interrupt.

*EX0* - Enable or disable External Interrupt 0.

**IEN1\* (0C8h)** - The Interrupt Enable Number 1 register allows the software to select which interrupts are enabled per the table below. If a bit is 0, the interrupt is disabled. If a bit is 1, the interrupt is enabled.

7	6	5	4	3	2	1	0
-	-	<i>EGSTE</i>	<i>EDMA1</i>	<i>EGSTV</i>	<i>EDMA0</i>	<i>EGSRE</i>	<i>EGSRV</i>

*EGSTE* - Enable or disable GSC Transmit Error interrupt.

*EDMA1* - Enable or disable DMA channel 1 interrupt.

*EGSTV* - Enable or disable GSC Transmit Valid interrupt.

*EDMA0* - Enable or disable DMA channel 0 interrupt.

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

*EGSRE* - Enable or disable GSC Receive Error interrupt.

*EGSRV* - Enable or disable GSC Receive Valid interrupt.

**IFS (0A4h)** - The Interframe Spacing register determines the number of bit times between transmitted frames in both CSMA/CD and SDLC. Only even bit times can be used. The number written to this register is divided by two and loaded into the seven most significant bits. An interframe space is created by counting down this seven bit number twice. The value read from this register is the current count value in the upper seven bits and the first or second count down in the LSB. A 1 indicates the first count down and a 0 indicates the second count down. The value may not be valid since the register is clocked asynchronously to the CPU.

**IP\* (0B8h)** - The Interrupt Priority register allows the software to select which interrupts have a higher than normal priority. If a bit is 0, the interrupt has normal priority. If a bit is 1, the interrupt has a higher priority. When multiple bits are set to higher priority, interrupts are resolved in the same order as their normal priority setting.

7	6	5	4	3	2	1	0
-	-	-	<i>PS</i>	<i>PT1</i>	<i>PX1</i>	<i>PT0</i>	<i>PX0</i>

*PS* - Set normal or higher priority level for serial port interrupt.

*PT1* - Set normal or higher priority level for Timer 1 overflow interrupt.

*PX1* - Set normal or higher priority level for External Interrupt 1.

*PT0* - Set normal or higher priority level for Timer 0 overflow interrupt.

*PX0* - Set normal or higher priority level for External Interrupt 0.

**IPN1\* (0F8h)** - The Interrupt Enable Number 1 register allows the software to select which interrupts have a higher than normal priority. If a bit is 0, the interrupt has normal priority. If a bit is 1, the interrupt has a higher priority. When multiple bits are set to higher priority, interrupts are resolved in the same order as their normal priority setting.

7	6	5	4	3	2	1	0
-	-	<i>PGSTE</i>	<i>PDMA1</i>	<i>PGSTV</i>	<i>PDMA0</i>	<i>PGSRE</i>	<i>PGSRV</i>

*PGSTE* - Set normal or higher priority level for GSC Transmit Error interrupt.

*PDMA1* - Set normal or higher priority level for DMA channel 1 interrupt.

*PGSTV* - Set normal or higher priority level for GSC Transmit Valid interrupt.

*PDMA0* - Set normal or higher priority level for DMA channel 0 interrupt.

*PGSRE* - Set normal or higher priority level for GSC Receive Error interrupt.

*PGSRV* - Set normal or higher priority level for GSC Receive Valid interrupt.

**MYSLOT (0F5h)** - Register that controls the slot address for the devices as well as the type of Jam used and which backoff algorithm is used during a collision.

7	6	5	4	3	2	1	0
<i>DCJ</i>	<i>DCR</i>	<i>SA5</i>	<i>SA4</i>	<i>SA3</i>	<i>SA2</i>	<i>SA1</i>	<i>SA0</i>

*SA5-0* - The six slot address bits determine not only the address but also the priority. Addresses 0 through 63 are available with 63 having the highest priority and 1 the lowest. An address of 0 will prevent a station from transmitting during the collision resolution period.

*DCR* - The Deterministic Collision Resolution register determines which resolution algorithm to use. Setting this bit

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

to a 1 selects the alternate collision resolution algorithm. Also disabled by setting this bit is the retriggering of the IFS on the reappearance of the carrier. Alternate Backoff mode must be used with this feature. The user must initialize TCDCNT with the maximum number of slots that are appropriate for the system. To disable the PBRS this register must be set to all 1s.

*DCJ* - A 1 selects DC type jam. A 0 selects AC type jam.

**P0\*, P1\*, P2\*, P3\*, P4\*, P5, P6 (080h, 090h, 0A0h, 0C0h, 091h, 0A1h)** - These registers are for I/O as defined in the table below. Most registers have a dual function. P5 and P6 are not bit addressable and are only available in the JB and JD versions of the IC.

Port		Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
P0	Function	Multiplexed Address/Data							
	Bit Address	087h	086h	085h	084h	083h	082h	081h	080h
P1	Function	-	HLDA	HLD	RXCn	TXCn	DENn	GTXD	GRXD
	Bit Address	097h	096h	095h	094h	093h	092h	091h	090h
P2	Function	Address and User Defined							
	Bit Address	0A7h	0A6h	0A5h	0A4h	0A3h	0A2h	0A1h	0A0h
P3	Function	RDn	WRn	T1	T0	INT1n	INT0n	TXD	RXD
	Bit Address	0B7h	0B6h	0B5h	0B4h	0B3h	0B2h	0B1h	0B0h
P4	Function	User Defined							
	Bit Address	0C7h	0C6h	0C5h	0C4h	0C3h	0C2h	0C1h	0C0h
P5	Function	User Defined							
	Bit Address	091h							
P6	Function	User Defined							
	Address	0A1h							

**PCON (087h)** - The Power CONtrol register controls the power down and idle states of the 80C152 as well as various UART, GSC, and DMA functions as defined below.

7	6	5	4	3	2	1	0
<i>SMOD</i>	<i>ARB</i>	<i>REQ</i>	<i>GAREN</i>	<i>XRCLK</i>	<i>GFIEN</i>	<i>PD</i>	<i>IDL</i>

*SMOD* - Doubles the baud rate of the UART if the bit is set to 1.

*ARB* - The DMA (both channels) is put into ARBiter mode if the bit is set to 1.

*REQ* - The DMA (both channels) is put into REQuester mode if the bit is set to 1.

*GAREN* - The GSC Auxiliary Receive Enable allows the GSC to receive back-to-back SDLC frames by setting the bit to 1. This bit has no effect in CSMA mode.

*XRCLK* - Setting this bit enables the External Receive Clock to be used by the receiver portion of the GSC.

*GFIEN* - The GSC Flag Idle Enable bit generates idle flags between transmitted SDLC frames when this bit is set to a 1. This bit has no effect in CSMA mode.

*PD* - The Power Down bit puts the 80C152 into the power down power saving mode by setting this bit to a 1.

*IDL* - The IDLe bit puts the 80C152 into the idle power saving mode by setting this bit to a 1.

**PRBS (0E4h)** - This register contains the pseudo-random number to be used in the CSMA/CD backoff algorithm. The number is generated by using a feedback shift register clocked by the CPU phase clocks. Writing all 1s to this register will cause the register to freeze at all 1s. Writing any other value to it will cause it to start again. A read of this register will not always give the seed value due to the register being clocked by the CPUs phase clocks.

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

**PSW\* (0D0h)** - The Program Status Word register provides arithmetic and other microcontroller status as well as control for the selection of register banks 0 through 4.

7	6	5	4	3	2	1	0
<i>CY</i>	<i>AC</i>	<i>F0</i>	<i>RS1</i>	<i>RS0</i>	<i>OV</i>	-	<i>P</i>

*CY* - Carry Flag set to 1 if an instruction execution results in a carry.

*AC* - Auxiliary Carry Flag set to 1 if an instruction execution results in a carry.

*F0* - Flag 0 available for user defined general purpose.

*RS1, RS0* - Register bank Select 1 bit and Register bank Select 0 bit in combination define the current register bank to be used by the microprocessor. See table below.

Register Bank	<i>RS1</i>	<i>RS0</i>	Register Bank Addresses
0	0	0	00h-07h
1	0	1	08h-0Fh
2	1	0	10h-17h
3	1	1	18h-1fh

*OV* - The OVerflow bit indicates an arithmetic overflow when set to a 1.

*P* - Parity flag set or cleared by the hardware each instruction to indicate odd or even number of 1's in the accumulator.

**RFIFO (0F4h)** - This is a 3 byte buffer which points to the oldest data in the buffer. The buffer is loaded with receive data every time the receiver receives a new byte of data.

**RSTAT\* (0E8h)** - This register provides status of the GSC receiver as defined below.

7	6	5	4	3	2	1	0
<i>OR</i>	<i>RCABT</i>	<i>AE</i>	<i>CRCE</i>	<i>RDN</i>	<i>RFNE</i>	<i>GREN</i>	<i>HABEN</i>

*HABEN* - The Hardware Based Acknowledge Enable when set to a 1 enables this feature.

*GREN* - When this bit is set the receiver is enabled to accept incoming frames. RFIFO should be cleared before setting this bit by reading RFIFO until RFNE = 0. This should be done since setting GREN to a 1 clears RFIFO. It takes twelve clock cycles for the status of RFNE to be updated after a read of RFIFO. Setting GREN also clears RDN, CRCE, AE and RCABT. GREN is cleared by hardware at the end of a reception or if receive errors are encountered. The user is responsible for setting this bit to a 1. The user or the GSC can set this bit to a 0. In CSMA/CD mode the status of GREN has no effect on whether the receiver detects a collision since the receiver always monitors the receive pin.

*RFNE* - This bit if set indicates that the receive FIFO is not empty. This flag is controlled by the GSC. If all the data is read from the FIFO the GSC will clear the bit.

*RDN* - This bit is controlled by the GSC and if set indicates a successful receive operation has occurred. This bit will not be set if a CRC, alignment, abort, or FIFO overrun error occurred.

*CRCE* - This bit is controlled by the GSC and if set indicates that a properly aligned frame was received without a mismatched CRC.

*AE* - This bit is set by the GSC in CSMA/CD mode to indicate that the receiver shift register is not full and the CRC is bad when the EOF was detected. If the CRC is correct AE will not be set and a misalignment will be assumed to be caused by 'dribble bits' as the line went idle. In SDLC mode AE is set if a non-byte aligned flag is received. CRCE may also be set.

*RCABT* - This bit is set by the GSC when a collision is detected after data has been loaded into the receive FIFO in

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

CSMA/CD mode. In SDLC mode this bit indicates that 7 consecutive 1s were detected before an end flag but after data was loaded into the receive FIFO. AE may also be set.

OR - This bit is set by the GSC to indicate that the receive FIFO was full and then new data was shifted into it. AE and /or CRCE may also be set. This flag is cleared by the user.

**SARL0, SARH0 (0A2h, 0A3h)** - Source address register high and low bytes for DMA channel 0. The two registers provide a 16-bit value representing the address of the source for a DMA transfer via channel 0. Valid address range is from 0 to 65535.

**SARL1, SARH1 (0B2h, 0B3h)** - Source address register high and low bytes for DMA channel 1. The two registers provide a 16-bit value representing the address of the source for a DMA transfer via channel 1. Valid address range is from 0 to 65535.

**SBUF (099h)** - Writes to this register load the transmit register, and reads access the receive register.

**SCON\* (098h)** - This register controls the set up of the UART as defined by the table below.

7	6	5	4	3	2	1	0
SM0	SM1	SM2	REN	TB8	RB8	TI	RI

SM0, SM1 - The combination of these 2 bits controls the mode and type of baud rate.

Mode	SM0	SM1	Description	Baud Rate
0	0	0	Shift Register	(Osc. Freq.)/12
1	0	1	8-bit UART	Variable
2	1	0	9-bit UART	(Osc. Freq.)/64 or (Osc. Freq.)/32
3	1	1	9-bit UART	Variable

SM2 - When this bit is set and the UART mode is 1, RI will not be activated unless a valid stop bit is received. When this bit is set and the UART mode is 2 or 3, RI will not be activated if the 9th bit is 0.

REN - Setting this bit enables the UART to receive. Clearing this bit disables UART reception.

TB8 - In modes 2 and 3, the value of this bit is transmitted during the 9th bit time. This bit is set or cleared by software.

RB8 - In modes 2 and 3, this bit is the value of the 9th bit that was received by the UART. In mode 1, this bit is the value of the stop bit received by the UART.

TI - Transmit Interrupt flag set by hardware upon at the end of the 8th bit in mode 0 or at the beginning of the stop bit in modes 1, 2, or 3. This bit must be cleared by software to clear the interrupt.

RI - Receive Interrupt flag set by hardware at the end of the 8th bit in mode 0 or halfway through the stop bit in modes 1, 2, or 3. This bit must be cleared by software to clear the interrupt.

**SLOTTM (0B4h)** - Determines the length of the slot time in CSMA/CD mode. A slot time equals SLOTTM \* (1 / baud rate). Reads from this location are unreliable since this register is clocked asynchronously to the CPU. Loading a value of 0 results in a slot time of 256 bit times.

**SP (081h)** - This register is the stack pointer. Its value points to the memory location that is the beginning of the stack.

**TCDCNT (0D4h)** - If probabilistic CSMA/CD is used this register contains the number of collisions. The user must clear this register before transmitting a new frame so the GSC can distinguish between a new frame and the retransmit of a frame. In deterministic backoff mode TCDCNT is used to hold the maximum number of slots.

**TCON\* (088h)** - This register controls the operation of the Timers 0 and 1 and External Interrupts 0 and 1 as defined by the table below.

## IA80C152

## Preliminary Data Sheet

## UNIVERSAL COMMUNICATIONS CONTROLLER

7	6	5	4	3	2	1	0
<i>TF1</i>	<i>TR1</i>	<i>TF0</i>	<i>TR0</i>	<i>IE1</i>	<i>IT1</i>	<i>IE0</i>	<i>IT0</i>

*TF1* - Timer overFlow 1 interrupt flag set by hardware when timer 1 overflows. Hardware clears this flag when the processor vectors to the interrupt service routine.

*TR1* - Timer Run 1 flag set by software to turn on timer 1 and cleared by software to turn off timer 1.

*TF0* - Timer overFlow 0 interrupt flag set by hardware when timer 0 overflows. Hardware clears this flag when the processor vectors to the interrupt service routine.

*TR0* - Timer Run 0 flag set by software to turn on timer 0 and cleared by software to turn off timer 0.

*IE1* - Interrupt External 1 flag set by hardware when an edge is detected on External Interrupt 1. Hardware clears this flag when the processor vectors to the interrupt service routine.

*IT1* - Interrupt Trigger 1 flag is set by software to specify a falling edge triggered interrupt for External Interrupt 1. The flag is cleared by software to specify a low level triggered interrupt for External Interrupt 1.

*IE0* - Interrupt External 0 flag set by hardware when an edge is detected on External Interrupt 0. Hardware clears this flag when the processor vectors to the interrupt service routine.

*IT0* - Interrupt Trigger 0 flag is set by software to specify a falling edge triggered interrupt for External Interrupt 0. The flag is cleared by software to specify a low level triggered interrupt for External Interrupt 0.

**TFIFO (085h)** - This is the 3 byte buffer used for storing transmit data. If TEN is set to a 1 transmission begins as soon as data is written to TFIFO.

**TH0, TL0 (08Ch, 08Ah)** - These registers provide the high byte (TH0) and low byte (TL0) values for Timer 0. These registers may be used together or separately depending on Timer 0 mode bits.

**TH1, TL1 (08Dh, 08Bh)** - These registers provide the high byte (TH0) and low byte (TL0) values for Timer 0. These registers may be used together or separately depending on Timer 0 mode bits.

**TMOD (089h)** - This register controls the set up and modes of Timers 0 and 1 as defined by the table below.

7	6	5	4	3	2	1	0
Timer 1				Timer 0			
<i>GATE</i>	<i>C/Tn</i>	<i>M1</i>	<i>M0</i>	<i>GATE</i>	<i>C/Tn</i>	<i>M1</i>	<i>M0</i>

*GATE* - When this bit is set, Timers/Counters may be turned on or off by the corresponding External Interrupt, if the appropriate TR bit is set. When this bit is cleared, Timers/Counters may only be turned on or off by the appropriate TR bit.

*C/Tn* - Counter/Timer flag. Set by software for Counter operation, cleared by software for Timer operation.

*M1, M0* - Set the mode of the Timers/Counters as defined by the table below.

Mode	<i>M1</i>	<i>M0</i>	Description
0	0	0	13-bit Timer
1	0	1	16-bit Timer/Counter
2	1	0	8-bit Auto Reload Timer/Counter
3	1	1	One 8-bit Timer/Counter (TL0) controlled by Timer 0 control bits. One 8-bit Timer/Counter (TH0) controlled by Timer 1 control bits.

**TSTAT\* (0D8h)** - This register provides status of the GSC transmitter as defined below.

**UNIVERSAL COMMUNICATIONS CONTROLLER**

7	6	5	4	3	2	1	0
<i>LNI</i>	<i>NOACK</i>	<i>UR</i>	<i>TCDT</i>	<i>TDN</i>	<i>TFNF</i>	<i>TEN</i>	<i>DMA</i>

*DMA* - If this bit is set it indicates that the DMA channels are used to service the RFIFO and TFIFO and that GSC interrupts occur on TDN and RDN. If set it also enables UR to become set. If this bit is cleared it indicates that the GSC is operating in normal mode and interrupts occur on TFNF and RFNE.

*TEN* - When TEN is set it will cause TDN, UR, TCDT and NOACK to be reset and the TFIFO to be cleared. The transmitter will clear TEN after a successful transmission, a collision during data, CRC or end flag. The user sets the bit and the user of the GSC can clear the bit. If the bit is cleared during a transmission the transmit pin goes to a high level. This is the method used to send an abort character in SDLC. DEN is also forced to a high level. An end of transmission occurs whenever the TFIFO is emptied.

*TFNF* - If this bit is a 1 TFIFO is not full and new data may be written to it.

*TDN* - The GSC sets this bit to indicate that a frame transmission completed successfully. If HABEN is set, TDN will not be set until the end of the IFS so that the acknowledge can be checked. TDN will not be set if an acknowledge is expected but not received. An acknowledge will not be expected after a broadcast or a multi-cast packet.

*TCDT* - The GSC sets this bit to indicate that the transmission stopped due to a collision. The bit is set by a collision occurring during the data, the CRC or if there are more than 8 collisions.

*UR* - The GSC sets this bit to indicate that in DMA mode the last bit was shifted out of the transmit register and that the DMA byte count did not equal 0. When this occurs the transmitter stops without sending the CRC and the end flag.

*NOACK* - The GSC sets this bit to indicate that an acknowledge was not received for the previous frame. This bit will be set only if HABEN is set and no acknowledge is received before the end of the IFS. NOACK will not be set following a broadcast or a multi-cast packet.

*LNI* - The GSC sets this bit to indicate that the receive line is idle. In CSMA/CD mode LNI is set if GRXD remains high for ~ 1.6 bit times. LNI is cleared after a transition on GRXD. In SDLC node LNI is set if 15 consecutive ones are received.

**UNIVERSAL COMMUNICATIONS CONTROLLER****Absolute Maximum Ratings****AC/DC Parameters**

Ambient temperature under bias.....	-40°C to +85°C <sup>(2)</sup>
Operating temperature... ..	-40°C to +85°C
Storage temperature.....	-65°C to +150°C
Voltage on any pin to VSS.....	-0.3 to (V <sub>DD</sub> +0.3)
Power dissipation.....	391.1 mW (95°C, 16MHz, 15% Toggle)

Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. Operating the device beyond the conditions indicated in the “recommended operating conditions” section is not recommended. Operation at the “absolute maximum ratings” may adversely affect device reliability.

Notes: Design, Static and Dynamic Timing Characterization in Progress.

**Table 8: DC Characteristics**

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V <sub>IL</sub>	Input Low Voltage (All Except EAn, EBEN)				V	
V <sub>IL1</sub>	Input Low Voltage (EAn, EBEN)				V	
V <sub>IH</sub>	Input High Voltage ( Except XTAL1, RSTn)				V	
V <sub>IH1</sub>	Input High Voltage ( XTAL1 RSTn)				V	
V <sub>OL</sub>	Output Low Voltage (Ports 1, 2, 3, 4, 5, 6)				V	
V <sub>OL1</sub>	Output Low Voltage (Ports 0, ALE,PSEnN, EPSEnN)				V	
V <sub>OH</sub>	Output High Voltage (Ports 1, 2, 3, 4, 5, 6, COMM9 ALE, PSEnN, EPSEnN)				V	
					V	
V <sub>OH1</sub>	Output High Voltage (Port 0 in External Bus Mode)				V	
					V	
I <sub>IL</sub>	Logical 0 Input Current (Ports 1, 2, 3, 4, 5, 6)				μA	
I <sub>TL</sub>	Logical 1 to 0 Transition Current (Ports 1, 2, 3, 4, 5, 6)				μA	
I <sub>LI</sub>	Input Leakage ( Port 0, EAn)				μA	
RRST	Reset Pull-up Resistor				kΩ	
I <sub>IH</sub>	Logical 1 Input Current (EBEN)				μA	
I <sub>DD</sub>	Power Supply Current: Active (16.5 MHz) Idle(16.5 MHz) Power Down Mode				mA	
					mA	
			100		μA	(1)

**Notes:**

(1) Static I<sub>DD</sub> current is exclusive of input/output drive requirements and is measured with the clocks stopped and all inputs tied to V<sub>DD</sub> or V<sub>SS</sub>, configured to draw minimum current.

(2) The input and output parametric values in section VII-B, parts 1, 2, and 3, are directly related to ambient temperature and DC supply voltage. A temperature or supply voltage range other than those specified in the Operating Conditions above will affect these values and part performance is not guaranteed by **innovASIC**.
