## 400 $\mu \mathrm{A}$ High-Speed Operational Amplifier

■ OptimWatt ${ }^{\text {TM }}$ device featuring ultra-low consumption, 2 mW , and low quiescent current, $400 \mu \mathrm{~A}$
■ Bandwidth: 120MHz (Gain=2)
■ Slew rate: $115 \mathrm{~V} / \mu \mathrm{s}$
■ Specified on $1 \mathrm{k} \Omega$
■ Input noise: $7.5 \mathrm{nV} / \sqrt{ } \mathrm{Hz}$
■ Tested on 5V power supply

## Description

The TSH310 is a very low-power, high-speed operational amplifier. A bandwidth of 120 MHz is achieved while drawing only $400 \mu \mathrm{~A}$ of quiescent current. This low-power characteristic is particularly suitable for high-speed, batterypowered equipment requiring dynamic performance.

The TSH310 is a single operator available in SO8 and the tiny SOT23-5 plastic package, saving board space as well as providing excellent thermal performances.

## Applications

■ Battery-powered and high-speed systems
■ Communication \& video test equipment

- Portable medical instrumentation
- ADC drivers

Pin Connections (top view)

## Order Codes

| Part Number | Temperature Range | Package | Conditioning | Marking |
| :--- | :---: | :---: | :---: | :---: |
| TSH310ILT | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | SOT23- | Tape\&Reel | K304 |
|  |  | SO-8 | Tube | TSH310I |
|  |  | SO-8 | Tape\&Reel | TSH310I |
| TSH310IDT |  |  |  |  |

## 1 Absolute Maximum Ratings

Table 1: Key parameters and their absolute maximum ratings

| Symbol | Parameter | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{CC}}$ | Supply Voltage ${ }^{1}$ | 6 | V |
| $\mathrm{V}_{\text {id }}$ | Differential Input Voltage ${ }^{2}$ | +/-0.5 | V |
| $\mathrm{V}_{\text {in }}$ | Input Voltage Range ${ }^{3}$ | +/-2.5 | V |
| Toper | Operating Free Air Temperature Range | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage Temperature | -65 to +150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\mathrm{j}}$ | Maximum Junction Temperature | 150 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{R}_{\text {thja }}$ | Thermal Resistance Junction to Ambient SOT23-5 SO8 | $\begin{aligned} & 250 \\ & 150 \\ & \hline \end{aligned}$ | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {thic }}$ | Thermal Resistance Junction to Case SOT23-5 SO8 | $\begin{aligned} & 80 \\ & 28 \end{aligned}$ | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{P}_{\max }$ | Maximum Power Dissipation ${ }^{4}$ ( $@ \mathrm{Ta}=25^{\circ} \mathrm{C}$ ) for $\mathrm{Tj}=150^{\circ} \mathrm{C}$ SOT23-5 SO8 | $\begin{aligned} & 500 \\ & 830 \end{aligned}$ | mW |
| ESD | HBM: Human Body Model ${ }^{5}$ (pins 1, 4, 5, 6, 7 and 8) | 2 | kV |
|  | HBM: Human Body Model (pins 2 and 3) | 0.5 | kV |
|  | MM: Machine Model ${ }^{6}$ (pins 1, 4, 5, 6, 7 and 8) | 200 | V |
|  | MM: Machine Model (pins 2 and 3) | 60 | V |
|  | CDM: Charged Device Model (pins 1, 4, 5, 6, 7 and 8) | 1.5 | kV |
|  | CDM: Charged Device Model (pins 2 and 3) | 1.5 | kV |
|  | Latch-up Immunity | 200 | mA |

1) All voltages values are measured with respect to the ground pin.
2) Differential voltage are non-inverting input terminal with respect to the inverting input terminal.
3) The magnitude of input and output voltage must never exceed $\mathrm{V}_{\mathrm{CC}}+0.3 \mathrm{~V}$.
4) Short-circuits can cause excessive heating. Destructive dissipation can result from short circuit on amplifiers.
5) Human body model, 100 pF discharged through a $1.5 \mathrm{k} \Omega$ resistor into pMin of device.
6) This is a minimum Value. Machine model ESD, a 200pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (internal resistor $<5 \Omega$ ), into pin to pin of device.

Table 2: Operating conditions

| Symbol | Parameter | Value | Unit |
| :---: | :--- | :---: | :---: |
| $\mathbf{V}_{\mathbf{C c}}$ | Supply Voltage ${ }^{1}$ | 4.5 to 5.5 | V |
| $\mathbf{V}_{\mathbf{i c m}}$ | Common Mode Input Voltage | $-\mathrm{Vcc}+1.5 \mathrm{~V},+\mathrm{Vcc}-1.5 \mathrm{~V}$ | V |

1) Tested in full production at $5 \mathrm{~V}( \pm 2.5 \mathrm{~V})$ supply voltage.

## 3 Evaluation Boards

An evaluation board kit optimized for high-speed operational amplifiers is available (order code: KITHSEVAL/STDL). The kit includes the following evaluation boards, as well as a CD-ROM containing datasheets, articles, application notes and a user manual:

- SOT23_SINGLE_HF BOARD: Board for the evaluation of a single high-speed op-amp in SOT23-5 package.
- SO8_SINGLE_HF: Board for the evaluation of a single high-speed op-amp in SO8 package.
- SO8_DUAL_HF: Board for the evaluation of a dual high-speed op-amp in SO8 package.
- SO8_S_MULTI: Board for the evaluation of a single high-speed op-amp in SO8 package in inverting and non-inverting configuration, dual and single supply.
- SO14_TRIPLE: Board for the evaluation of a triple high-speed op-amp in SO14 package with video application considerations.

## Board material:

- 2 layers
- FR4 ( $\mathcal{E r}=4.6$ )
- epoxy 1.6 mm
- copper thickness: $35 \mu \mathrm{~m}$

Figure 25: Evaluation kit for high-speed op-amps

## 4 Power Supply Considerations

Correct power supply bypassing is very important for optimizing performance in high-frequency ranges. Bypass capacitors should be placed as close as possible to the IC pins to improve high-frequency bypassing. A capacitor greater than $1 \mu \mathrm{~F}$ is necessary to minimize the distortion. For better quality bypassing, a capacitor of 10 nF can be added using the same implementation conditions. Bypass capacitors must be incorporated for both the negative and the positive supply.

For example: on the SO8_SINGLE_HF board, these capacitors are C6, C7, C8, C9.
Figure 26: Circuit for power supply bypassing

## Single power supply

In the event that a single supply system is used, new biasing is necessary to assume a positive output dynamic range between OV and $+\mathrm{V}_{\mathrm{CC}}$ supply rails. Considering the values of VoH and VoL , the amplifier will provide an output dynamic from +0.9 V to +4.1 V on $1 \mathrm{k} \Omega$ load.

The amplifier must be biased with a mid-supply (nominally $+\mathrm{V}_{\mathrm{CC}} / 2$ ), in order to maintain the DC component of the signal at this value. Several options are possible to provide this bias supply, such as a virtual ground using an operational amplifier or a two-resistance divider (which is the cheapest solution). A high resistance value is required to limit the current consumption. On the other hand, the current must be high enough to bias the non-inverting input of the amplifier. If we consider this bias current ( $55 \mu \mathrm{~A}$ max.) as the $1 \%$ of the current through the resistance divider to keep a stable mid-supply, two resistances of $470 \Omega$ can be used.

The input provides a high pass filter with a break frequency below 10 Hz which is necessary to remove the original 0 volt DC component of the input signal, and to fix it at $+\mathrm{V}_{\mathrm{CC}} / 2$.

Figure 27 illustrates a 5V single power supply configuration for the SO8_SINGLE evaluation board (see Evaluation Boards on page 9).

A capacitor $\mathrm{C}_{\mathrm{G}}$ is added in the gain network to ensure a unity gain in low frequency to keep the right DC component at the ouput. $\mathrm{C}_{\mathrm{G}}$ contributes to a high-pass filter with $\mathrm{R}_{\mathrm{fb}} / / \mathrm{R}_{\mathrm{G}}$ and its value is calculated with a consideration of the cut-off frequency of this low-pass filter.

Figure 27: Circuit for +5 V single supply

## 5 Noise Measurements

The noise model is shown in Figure 28, where:

- eN: input voltage noise of the amplifier
- iNn: negative input current noise of the amplifier
- iNp: positive input current noise of the amplifier

Figure 28: Noise model

The thermal noise of a resistance $R$ is:

$$
\sqrt{4 \mathrm{kTR} \Delta \mathrm{~F}}
$$

where $\Delta \mathrm{F}$ is the specified bandwidth.
On a 1 Hz bandwidth the thermal noise is reduced to

$$
\sqrt{4 \mathrm{kTR}}
$$

where k is the Boltzmann's constant, equal to $1,374.10-23 \mathrm{~J} /{ }^{\circ} \mathrm{K}$. T is the temperature $\left({ }^{\circ} \mathrm{K}\right)$.
The output noise eNo is calculated using the Superposition Theorem. However eNo is not the simple sum of all noise sources, but rather the square root of the sum of the square of each noise source, as shown in Equation 1:

$$
e N o=\sqrt{V 1^{2}+V 2^{2}+V 3^{2}+V 4^{2}+V 5^{2}+V 6^{2}}
$$

Equation 1

$$
e N o^{2}=e N^{2} \times g^{2}+i N n^{2} \times R 2^{2}+i N p^{2} \times R 3^{2} \times g^{2}+\frac{R_{2}}{R 1} \times 4 k T R 1+4 k T R 2+1+\frac{R 2^{2}}{R_{1}} \times 4 k T R 3
$$

Equation 2

The input noise of the instrumentation must be extracted from the measured noise value. The real output noise value of the driver is:

$$
\mathrm{eNo}=\sqrt{(\text { Measured })^{2}-(\text { instrumentation })^{2}}
$$

Equation 3

The input noise is called the Equivalent Input Noise as it is not directly measured but is evaluated from the measurement of the output divided by the closed loop gain (eNo/g).

After simplification of the fourth and the fifth term of Equation 2 we obtain:

$$
e N o^{2}=e N^{2} \times g^{2}+i N n^{2} \times R 2^{2}+i N p^{2} \times R 3^{2} \times g^{2}+g \times 4 k T R 2+1+\frac{R 2^{2}}{R 1} \times 4 k T R 3
$$

Equation 4

## Measurement of the input voltage noise eN

If we assume a short-circuit on the non-inverting input ( $\mathrm{R} 3=0$ ), from Equation 4 we can derive:

$$
e N o=\sqrt{e N^{2} \times g^{2}+i N n^{2} \times R 2^{2}+g \times 4 k T R 2}
$$

Equation 5

In order to easily extract the value of eN, the resistance R2 will be chosen to be as low as possible. In the other hand, the gain must be large enough:

$$
\text { R3=0, gain: } g=100
$$

## Measurement of the negative input current noise iNn

To measure the negative input current noise iNn, we set R3=0 and use Equation 5. This time the gain must be lower in order to decrease the thermal noise contribution:

$$
\mathrm{R} 3=0 \text {, gain: } \mathrm{g}=10
$$

## Measurement of the positive input current noise iNp

To extract iNp from Equation 3, a resistance R3 is connected to the non-inverting input. The value of R3 must be chosen in order to keep its thermal noise contribution as low as possible against the iNp contribution:

$$
R 3=100 \Omega \text {, gain: } g=10
$$

## 6 Intermodulation Distortion Product

The non-ideal output of the amplifier can be described by the following series:

$$
\text { vout }=C_{0}+C_{1} v_{i n}+C_{2} v^{2}{ }_{\text {in }}+\ldots C_{n} v^{n} \text { in }
$$

due to non-linearity in the input-output amplitude transfer, where the input is $V_{\text {in }}=A \sin \omega t, C_{0}$ is the $D C$ component, $\mathrm{C}_{1}\left(\mathrm{~V}_{\text {in }}\right)$ is the fundamental and $\mathrm{C}_{\mathrm{n}}$ is the amplitude of the harmonics of the output signal $\mathrm{V}_{\text {out }}$. A one-frequency (one-tone) input signal contributes to harmonic distortion. A two-tone input signal contributes to harmonic distortion and to the intermodulation product.

The study of the intermodulation and distortion for a two-tone input signal is the first step in characterizing the driving capability of multi-tone input signals.

In this case:

$$
v_{i n}=A \sin \omega_{1} t+A \sin \omega_{2} t
$$

then:

$$
v_{\text {out }}=C_{0}+C_{1}\left(A \sin \omega_{1} t+A \sin \omega_{2} t\right)+C_{2}\left(A \sin \omega_{1} t+A \sin \omega_{2} t\right)^{2} \ldots+C_{n}\left(A \sin \omega_{1} t+A \sin \omega_{2} t\right)^{n}
$$

From this expression, we can extract the distortion terms, and the intermodulation terms form a single sine wave: second-order intermodulation terms IM2 by the frequencies ( $\omega_{1}-\omega_{2}$ ) and ( $\omega_{1}+\omega_{2}$ ) with an amplitude of C2A ${ }^{2}$ and third-order intermodulation terms IM3 by the frequencies $\left(2 \omega_{1}-\omega_{2}\right)$, $\left(2 \omega_{1}+\omega_{2}\right)$, ($\left.\omega_{1}+2 \omega_{2}\right)$ and $\left(\omega_{1}+2 \omega_{2}\right)$ with an amplitude of $(3 / 4) \mathrm{C} 3 \mathrm{~A}^{3}$.

The measurement of the intermodulation product of the driver is achieved by using the driver as a mixer by a summing amplifier configuration (see Figure 29). In this way, the non-linearity problem of an external mixing device is avoided.

Figure 29: Inverting summing amplifier (using evaluation board SO8_S_MULTI)

## 7 The Bias of an Inverting Amplifier

A resistance is necessary to achieve a good input biasing, such as resistance R shown in Figure 30.
The magnitude of this resistance is calculated by assuming the negative and positive input bias current. The aim is to compensate for the offset bias current, which could affect the input offset voltage and the output DC component. Assuming lb-, lb+, Rin, Rfb and a zero volt output, the resistance R will be:

$$
\mathrm{R}=\frac{\mathrm{R}_{\mathrm{in}} \times \mathrm{R}_{\mathrm{fb}}}{\mathrm{R}_{\mathrm{in}}+\mathrm{R}_{\mathrm{fb}}}
$$

Figure 30: Compensation of the input bias current

## 8 Active Filtering

Figure 31: Low-pass active filtering, Sallen-Key

From the resistors $R_{f b}$ and $R_{G}$ we can directly calculate the gain of the filter in a classical non-inverting amplification configuration:

$$
A_{V}=g=1+\frac{R_{f b}}{R_{g}}
$$

We assume the following expression as the response of the system:

$$
T_{j \omega}=\frac{\operatorname{Vout}_{j \omega}}{\operatorname{Vin}_{j \omega}}=\frac{g}{1+2 \zeta \frac{j \omega}{\omega_{c}}+\frac{(j \omega)^{2}}{\omega_{c}{ }^{2}}}
$$

The cut-off frequency is not gain-dependent and so becomes:

$$
\omega_{C}=\frac{1}{\sqrt{\text { R1R2C1C2 }}}
$$

The damping factor is calculated by the following expression:

$$
\zeta=\frac{1}{2} \omega_{c}\left(C_{1} R_{1}+C_{1} R_{2}+C_{2} R_{1}-C_{1} R_{1} g\right)
$$

The higher the gain, the more sensitive the damping factor is. When the gain is higher than 1 , it is preferable to use some very stable resistor and capacitor values. In the case of R1=R2=R:

$$
\zeta=\frac{2 C_{2}-C_{1} \frac{R_{f b}}{R_{g}}}{2 \sqrt{C_{1} C_{2}}}
$$

Due to a limited selection of values of capacitors in comparison with resistors, we can $\mathrm{fix} \mathrm{C} 1=\mathrm{C} 2=\mathrm{C}$, so that:

$$
\zeta=\frac{2 R_{2}-R_{1} \frac{R_{f b}}{R_{g}}}{2 \sqrt{R_{1} R_{2}}}
$$
