

MCP1403/4/5

4.5A Dual High-Speed Power MOSFET Drivers

Features

- High Peak Output Current: 4.5A (typ.)
- Low Shoot-Through/Cross-Conduction Current in Output Stage
- Wide Input Supply Voltage Operating Range:
 - 4.5V to 18V
- High Capacitive Load Drive Capability:
 - 2200 pF in 15 ns
 - 5600 pF in 34 ns
- Short Delay Times: 40 ns (typ.)
- Low Supply Current:
 - With Logic '1' Input – 1.0 mA (typ.)
 - With Logic '0' Input – 150 μ A (typ.)
- Latch-Up Protected: Will Withstand 1.5A Reverse Current
- Logic Input Will Withstand Negative Swing Up To 5V
- Packages: 8-Pin SOIC, PDIP, 8-Pin 6x5 DFN, and 16-Pin SOIC

Applications

- Switch Mode Power Supplies
- Pulse Transformer Drive
- Line Drivers
- Motor and Solenoid Drive

General Description

The MCP1403/4/5 are a family of dual-inverting, dual-non-inverting, or complimentary output drivers. They can delivery high peak currents of 4.5A typically into capacitive loads. These devices also feature low shoot-through current, matched rise/fall times and propagation delays.

The MCP1403/4/5 drivers operate from a 4.5V to 18V single power supply and can easily charge and discharge 2200 pF gate capacitance in under 15 ns (typ). They provide low enough impedances in both the on and off states to ensure the MOSFETs intended state will not be affected, even by large transients. The input to the MCP1403/4/5 may be driven directly from either TTL or CMOS (3V to 18V).

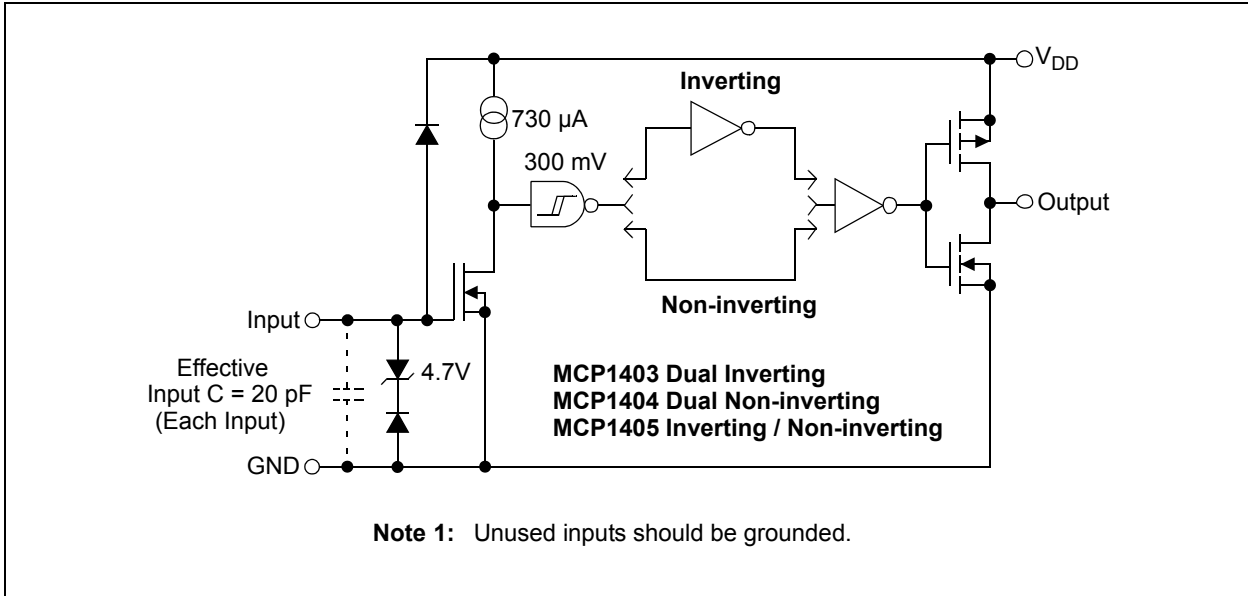

The MCP1403/4/5 dual-output 4.5A driver family is offered in both surface-mount and pin-through-hole packages with a -40°C to +125°C temperature rating. The low thermal resistance of the thermally enhanced DFN package allows for greater power dissipation capability for driving heavier capacitive or resistive loads.

These devices are highly latch-up resistant under any conditions within their power and voltage ratings. They are not subject to damage when up to 5V of noise spiking (of either polarity) occurs on the ground pin. All terminals are fully protect against Electrostatic Discharge (ESD) up to 4 kV.

Package Types

Functional Block Diagram (1)

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings †

Supply Voltage	+20V
Input Voltage	($V_{DD} + 0.3V$) to (GND – 5V)
Input Current ($V_{IN} > V_{DD}$).....	50 mA

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS (NOTE 2)

Electrical Specifications: Unless otherwise indicated, $T_A = +25^\circ\text{C}$, with $4.5V \leq V_{DD} \leq 18V$.						
Parameters	Sym	Min	Typ	Max	Units	Conditions
Input						
Logic '1', High Input Voltage	V_{IH}	2.4	1.5	—	V	
Logic '0', Low Input Voltage	V_{IL}	—	1.3	0.8	V	
Input Current	I_{IN}	-1	—	1	μA	$0V \leq V_{IN} \leq V_{DD}$
Input Voltage	V_{IN}	-5	—	$V_{DD}+0.3$	V	
Output						
High Output Voltage	V_{OH}	$V_{DD} - 0.025$	—	—	V	DC Test
Low Output Voltage	V_{OL}	—	—	0.025	V	DC Test
Output Resistance, High	R_{OH}	—	2.2	3.0	Ω	$I_{OUT} = 10 \text{ mA}$, $V_{DD} = 18V$
Output Resistance, Low	R_{OL}	—	2.8	3.5	Ω	$I_{OUT} = 10 \text{ mA}$, $V_{DD} = 18V$
Peak Output Current	I_{PK}	—	4.5	—	A	$V_{DD} = 18V$ (Note 2)
Latch-Up Protection Withstand Reverse Current	I_{REV}	—	>1.5	—	A	Duty cycle $\leq 2\%$, $t \leq 300 \mu\text{sec}$.
Switching Time (Note 1)						
Rise Time	t_R	—	15	28	ns	Figure 4-1, Figure 4-2 $C_L = 2200 \text{ pF}$
Fall Time	t_F	—	18	28	ns	Figure 4-1, Figure 4-2 $C_L = 2200 \text{ pF}$
Delay Time	t_{D1}	—	40	48	ns	Figure 4-1, Figure 4-2
Delay Time	t_{D2}	—	40	48	ns	Figure 4-1, Figure 4-2
Power Supply						
Supply Voltage	V_{DD}	4.5	—	18.0	V	
Power Supply Current	I_S	—	1.0	2.0	mA	$V_{IN} = 3V$ (Both Inputs)
	I_S	—	0.15	0.25	mA	$V_{IN} = 0V$ (Both Inputs)

Note 1: Switching times ensured by design.

2: Tested during characterization, not production tested.

DC CHARACTERISTICS (OVER OPERATING TEMPERATURE RANGE)

Electrical Specifications: Unless otherwise indicated, operating temperature range with $4.5V \leq V_{DD} \leq 18V$.						
Parameters	Sym	Min	Typ	Max	Units	Conditions
Input						
Logic '1', High Input Voltage	V_{IH}	2.4	—	—	V	
Logic '0', Low Input Voltage	V_{IL}	—	—	0.8	V	
Input Current	I_{IN}	-10	—	+10	μA	$0V \leq V_{IN} \leq V_{DD}$
Output						
High Output Voltage	V_{OH}	$V_{DD} - 0.025$	—	—	V	DC TEST
Low Output Voltage	V_{OL}	—	—	0.025	V	DC TEST
Output Resistance, High	R_{OH}	—	3.1	6.0	Ω	$I_{OUT} = 10 \text{ mA}$, $V_{DD} = 18V$
Output Resistance, Low	R_{OL}	—	3.7	7	Ω	$I_{OUT} = 10 \text{ mA}$, $V_{DD} = 18V$
Switching Time (Note 1)						
Rise Time	t_R	—	25	40	ns	Figure 4-1, Figure 4-2 $C_L = 2200 \text{ pF}$
Fall Time	t_F	—	25	40	ns	Figure 4-1, Figure 4-2 $C_L = 2200 \text{ pF}$
Delay Time	t_{D1}	—	50	65	ns	Figure 4-1, Figure 4-2
Delay Time	t_{D2}	—	50	65	ns	Figure 4-1, Figure 4-2
Power Supply						
Power Supply Current	I_S	—	2.0	3.0	mA	$V_{IN} = 3V$ (Both Inputs) $V_{IN} = 0V$ (Both Inputs)

Note 1: Switching times ensured by design.

2: Tested during characterization, not production tested.

TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, all parameters apply with $4.5V \leq V_{DD} \leq 18V$.						
Parameters	Sym	Min	Typ	Max	Units	Conditions
Temperature Ranges						
Specified Temperature Range	T_A	-40	—	+125	$^{\circ}C$	
Maximum Junction Temperature	T_J	—	—	+150	$^{\circ}C$	
Storage Temperature Range	T_A	-65	—	+150	$^{\circ}C$	
Package Thermal Resistances						
Thermal Resistance, 8L-6x5 DFN	θ_{JA}	—	33.2	—	$^{\circ}C/W$	Typical four-layer board with vias to ground plane
Thermal Resistance, 8L-PDIP	θ_{JA}	—	125	—	$^{\circ}C/W$	
Thermal Resistance, 8L-SOIC	θ_{JA}	—	155	—	$^{\circ}C/W$	
Thermal Resistance, 16L-SOIC	θ_{JA}	—	155	—	$^{\circ}C/W$	4-Layer JC51-7 Standard Board, Natural Convection

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, $T_A = +25^\circ\text{C}$ with $4.5\text{V} \leq V_{DD} \leq 18\text{V}$.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

TABLE 3-1: PIN FUNCTION TABLE ⁽¹⁾

8-Pin PDIP SOIC	8-Pin DFN	16-Pin SOIC	Symbol	Description
1	1	1	NC	No Connection
2	2	2	IN A	Control Input for Output A
—	—	3	NC	No Connection
3	3	4	GND	Ground
—	—	5	GND	Ground
—	—	6	NC	No Connection
4	4	7	IN B	Control Input for Output B
—	—	8	NC	No Connection
—	—	9	NC	No Connection
5	5	10	OUT B	Output B
—	—	11	OUT B	Output B
6	6	12	V _{DD}	Supply Input
—	—	13	V _{DD}	Supply Input
7	7	14	OUT A	Output A
—	—	15	OUT A	Output A
8	8	16	NC	No Connection
—	PAD	—	NC	Exposed Metal Pad

Note 1: Duplicate pins must be connected for proper operation.

3.1 Supply Input (V_{DD})

V_{DD} is the bias supply input for the MOSFET driver and has a voltage range of 4.5V to 18V. This input must be decoupled to ground with a local capacitor. This bypass capacitor provides a localized low-impedance path for the peak currents that are to be provided to the load.

3.2 Control Inputs A and B

The MOSFET driver input is a high-impedance, TTL/CMOS-compatible input. The input also has hysteresis between the high and low input levels, allowing them to be driven from slow rising and falling signals, and to provide noise immunity.

3.3 Ground (GND)

Ground is the device return pin. The ground pin should have a low impedance connection to the bias supply source return. High peak currents will flow out the ground pin when the capacitive load is being discharged.

3.4 Outputs A and B

Outputs A and B are CMOS push-pull output that is capable of sourcing and sinking 4.5A of peak current (V_{DD} = 18V). The low output impedance ensures the gate of the external MOSFET will stay in the intended state even during large transients. These output also has a reverse current latch-up rating of 1.5A.

3.5 Exposed Metal Pad

The exposed metal pad of the DFN package is not internally connected to any potential. Therefore, this pad can be connected to a ground plane or other copper plane on a printed circuit board to aid in heat removal from the package.

4.0 APPLICATION INFORMATION

4.1 General Information

MOSFET drivers are high-speed, high current devices which are intended to source/sink high peak currents to charge/discharge the gate capacitance of external MOSFETs or IGBTs. In high frequency switching power supplies, the PWM controller may not have the drive capability to directly drive the power MOSFET. A MOSFET driver like the MCP1403/4/5 family can be used to provide additional source/sink current capability.

4.2 MOSFET Driver Timing

The ability of a MOSFET driver to transition from a fully off state to a fully on state are characterized by the drivers rise time (t_R), fall time (t_F), and propagation delays (t_{D1} and t_{D2}). The MCP1403/4/5 family of drivers can typically charge and discharge a 2200 pF load capacitance in 15 ns along with a typical matched propagation delay of 40 ns. Figure 4-1 and Figure 4-2 show the test circuit and timing waveform used to verify the MCP1403/4/5 timing.

FIGURE 4-1: Inverting Driver Timing Waveform.

FIGURE 4-2: Non-Inverting Driver Timing Waveform.

4.3 Decoupling Capacitors

Careful layout and decoupling capacitors are highly recommended when using MOSFET drivers. Large currents are required to charge and discharge capacitive loads quickly. For example, 2.5A are needed to charge a 2200 pF load with 18V in 16 ns.

To operate the MOSFET driver over a wide frequency range with low supply impedance a ceramic and low ESR film capacitor are recommended to be placed in parallel between the driver V_{DD} and GND. A 1.0 μF low ESR film capacitor and a 0.1 μF ceramic capacitor placed between V_{DD} and GND pins should be used. These capacitors should be placed close to the driver to minimized circuit board parasitics and provide a local source for the required current.

4.4 PCB Layout Considerations

Proper PCB layout is important in a high current, fast switching circuit to provide proper device operation and robustness of design. PCB trace loop area and inductance should be minimized by the use of ground planes or trace under MOSFET gate drive signals, separate analog and power grounds, and local driver decoupling.

Placing a ground plane beneath the MCP1403/4/5 will help as a radiated noise shield as well as providing some heat sinking for power dissipated within the device.

4.5 Power Dissipation

The total internal power dissipation in a MOSFET driver is the summation of three separate power dissipation elements.

$$P_T = P_L + P_Q + P_{CC}$$

Where:

P_T = Total power dissipation

P_L = Load power dissipation

P_Q = Quiescent power dissipation

P_{CC} = Operating power dissipation

4.5.1 CAPACITIVE LOAD DISSIPATION

The power dissipation caused by a capacitive load is a direct function of frequency, total capacitive load, and supply voltage. The power lost in the MOSFET driver for a complete charging and discharging cycle of a MOSFET is:

$$P_L = f \times C_T \times V_{DD}^2$$

Where:

f = Switching frequency

C_T = Total load capacitance

V_{DD} = MOSFET driver supply voltage

4.5.2 QUIESCENT POWER DISSIPATION

The power dissipation associated with the quiescent current draw depends upon the state of the input pin. The MCP1403/4/5 devices have a quiescent current draw when both inputs are high of 1.0 mA (typ) and 0.15 mA (typ) when both inputs are low. The quiescent power dissipation is:

$$P_Q = (I_{QH} \times D + I_{QL} \times (1 - D)) \times V_{DD}$$

Where:

I_{QH} = Quiescent current in the high state

D = Duty cycle

I_{QL} = Quiescent current in the low state

V_{DD} = MOSFET driver supply voltage

4.5.3 OPERATING POWER DISSIPATION

The operating power dissipation occurs each time the MOSFET driver output transitions because for a very short period of time both MOSFETs in the output stage are on simultaneously. This cross-conduction current leads to a power dissipation describes as:

$$P_{CC} = CC \times f \times V_{DD}$$

Where:

CC = Cross-conduction constant (A*sec)

f = Switching frequency

V_{DD} = MOSFET driver supply voltage

5.0 PACKAGING INFORMATION

5.1 Package Marking Information (Not to Scale)

8-Lead DFN

Example:

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

16-Lead SOIC (300 mil)

Example:

Legend:	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949:2002 ==

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
