## feATURES

- Three 100mA Buck Regulators, Each Drives Up to 10 LEDs with Fast NPN Current Sources
- Fast Current Sources for <1 1 s Pulse Widths (10,000:1 True Color PWM ${ }^{\text {TM }}$ Dimming at 100Hz)
- LEDs Disconnected in Shutdown
- Adaptive $\mathrm{V}_{\text {OUT }}$ for Increased Efficiency
- 6V to 60V Input Voltage Range
- $\pm 2 \%$ LED Current Matching
- External Resistor Sets LED Current for Each Channel
- Internal Compensation and Soft-Start
- Programmable Switching Frequency (200kHz to 1MHz)
- Synchronizable to External Clock
- Open LED Detection and Reporting
- Shorted LED Pin Protection and Reporting
- Programmable LED Thermal Derating
- Programmable Temperature Protection
- $5 \mathrm{~mm} \times 8 \mathrm{~mm}$ Thermally Enhanced QFN Package with a 0.6 mm High Voltage Pin Spacing

## APPLICATIONS

- LED Billboards and Signboards
- Mono, Multi, Full-Color LED Displays
- Large Screen Display LED Backlighting
- Automotive, Industrial, and Medical Displays

## 60V Triple Step-Down

## LED Driver

## DESCRIPTIOn

The LT®3597 is a 60V triple step-down LED driver capable of achieving 10,000:1 digital PWM dimming at 100 Hz with fast NPN current sources driving up to 10 LEDs in each channel. LED dimming can also be achieved via analog control of the CTRL1-3 pin.
The step-down switching frequency is programmed between200kHzand 1MHz. The frequency is also synchronizable to an external clock. The LT3597 provides maximum LED brightness while adhering to manufacturers' specifications for thermal derating. The derate temperature is programmed by placing a negative temperature coefficient (NTC) resistor on the master control pin.
The LT3597 adaptively controls $\mathrm{V}_{\text {OUT }}$ in order to achieve optimal efficiency. Other features include: $2 \%$ LED current matching between channels, open LED reporting, shorted LED protection, programmable LED current, and programmable temperature protection.

LT, LT, LTC and LTM are registered trademarks of Linear Technology Corporation. True Color PWM is a trademark of Linear Technology Corporation. All other trademarks are the property of their respective owners.

## TYPICAL APPLICATION

Triple Step-Down RGB Single Pixel LED Driver, 100mA Current

## ABSOLUTE MAXIMUM RATIOGS

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The LT3597E is guaranteed to meet performance specifications from $0^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ junction temperature. Specifications over the $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ operating junction temperature range are assured by design, characterization and correlation with statistical process controls. The LT3597I specifications are guaranteed over the full $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ operating junction temperature range.

Note 3: For Maximum Operating Ambient Temperature, see Thermal Considerations in the Applications Information section.
Note 4: Guaranteed by design.

## PIn fUnCTIOnS

BOOST1, BOOST2, BOOST3 (Pins 2, 48, 39): Boost Capacitor Pin. This pin is used to provide a voltage that is higher than the input voltage when the switch is on to supply current to the switch driver.

SW1, SW2, SW3 (Pins 4, 46, 41): Switch Pin. Connect the inductor, catch diode and boost capacitor to this pin.
DA1, DA2, DA3 (Pins 6, 44, 43): Catch Diode Anode. This pin is used to provide frequency foldback in extreme situations.

FB1, FB2, FB3 (Pins 7, 34, 35): Feedback Pin. This pin is regulated to the internal bandgap voltage. The maximum Buck output voltage can be set by connecting this pin to a resistor divider from VOUT1-3.
EN/UVLO (Pin 9): Enable and Undervoltage Lockout Pin. Accurate 1.51 V threshold. UVLO threshold can be programmed by using a resistor divider from $\mathrm{V}_{\text {IN }}$. If function is not required, pin can be tied to the VIN pin.
$\mathrm{T}_{\text {SEt }}$ (Pin 11): Thermal Regulation Pin. Programs the LT3597 junction temperature at which LED current begins to derate.
$V_{\text {ReF }}$ (Pin 12): 2.0V Reference Output Pin. This pin can sources up to $200 \mu \mathrm{~A}$ and can be used to program TSET and CTRLM.

CTRLM (Pin 13): Master Control Pin. LED current derating vs temperature is achievable for all channels if the voltage on CTRLM has a negative temperature coefficient using an external NTC resistor in a voltage divider from VREF.
$\mathrm{I}_{\text {SET1 }}, \mathrm{I}_{\mathrm{SET2}}$, $\mathrm{I}_{\mathrm{SET3}}$ (Pins 14, 15, 16): LED Current Programming Pin. A resistor to ground programs full-scale LED current.

RT (Pin 17): Switching Frequency Programming Pin. A resistor to ground programs the switching frequency between 200 kHz and 1 MHz .

GND (Pin 18, Exposed Pad Pin 53): Ground Pin. This is the ground for both the IC and the switching converters. Exposed pad must be soldered to PCB ground.
$\mathrm{V}_{\text {out1 }}, \mathrm{V}_{\text {OUT2 }}, \mathrm{V}_{\text {OUT3 }}$ (Pins 19, 22, 23): Buck Output. This is the buck regulator output voltage sense into the IC.
LED1, LED2, LED3 (Pins 20, 21, 24): Constant Current Sink Pin. These are 3 LED driver outputs, each containing an open collector, constant current sink. All outputs are matched within $\pm 2 \%$ and are individually programmed up to 100 mA using an external resistor at the ISET1-3 pin. Outputs are rated to allow a maximum VOUT1-3 of 42 V . Connect the cathode of the LED string to LED1-3. Connect the anode of the LED string to VOUT1-3.
FAULT (Pin 25): Fault Detection Pin. Open collector pin used to report open LED faults. FAULT must be externally pulled to a positive supply through a resistor.
NC (Pin 26): No Connection Pin. Tie to ground.
SYNC (Pin 27): External Clock Synchronization Pin. When an external clock drives this pin, the Buck regulators are synchronized to that frequency. Frequency programmed by the RT pin resistor must be at least $20 \%$ less than the SYNC pin clock frequency.
PWM1, PWM2, PWM3 (Pins 30, 29, 28): PWM Dimming Control Pin. Whendrivento a logic high, the LED1-3 current sink is enabled. If PWM dimming is not desired, connect the pin to VREF. Channels can be individually disabled by tying PWM1-3 to ground.

CTRL1, CTRL2, CTRL3(Pins 33, 32, 31):Analog Dimming Control Pin. This pin is used to dim the LED current in an analog fashion. If the pin is tied to a voltage lower than 1.0 V , it will linearly reduce the LED current. If feature is unused, connect the pin to VREF.

BIAS (Pin 37): Supply Pin. This pin is the supply for an internal voltage regulator to internal analog and digital circuitry. BIAS must be locally bypassed with a $2.2 \mu \mathrm{~F}$ capacitor.
$\mathrm{V}_{\text {IN }}$ (Pins 50, 51): Input Supply Pin. $\mathrm{V}_{\text {IN }}$ must be locally bypassed with a $10 \mu \mathrm{~F}$ capacitor to ground. Pins 50 and 51 are internally fused.

## BLOCK DIAGRAM

Figure 1. Block Diagram

## OPERATION

The LT3597 uses a constant frequency, internally compensated peak current mode control scheme. Operation is best understood by referring to the Block Diagram in Figure 1.

Enable and undervoltage lockout (UVLO) are both controlled by a single pin. If the pin falls below 1.51 V , an accurate comparator turns off the LED drivers and buck regulators. If the pin continues to fall to less than 0.4 V , the part enters shutdown and consumes less than $2 \mu \mathrm{~A}$.
The LT3597 contains three constant current sink LED drivers. Each of the three LED strings is powered from a dedicated adaptive buck converter in order to achieve maximum efficiency. The frequency of the buck regulators is programmed from 200 kHz to 1 MHz using an external resistor. The frequency can also be synchronized to an external clock using the SYNC pin.

Internal buck compensation and soft-start requires few external components and permits simple board layout. A high-side switch current limit protects the internal switch during its on time, while a low side current limit prevents the switch from turning on in the case of excessive off phase current.

## Step-Down Adaptive Control

Adaptive control of the output voltages achieves superior system efficiency. When a given channel's PWM pin is low, the respective buck regulator output will go to a programmable high output voltage. In this case the buck will enter into a pulse-skipping mode since there is no load connected. This guarantees that the buck output voltage is high enough to immediately supply the LED current once the string is reactivated. As soon as PWM goes high, the output voltage of the buck will drop until there
is 1 V across the LED current sink. This scheme ensures the best efficiency for each LED channel. Since each LED string is independently driven from a separate buck channel, efficiency is optimized for all three strings even if the number of LEDs is mismatched between the channels.

Another benefit of this regulation method is that the LT3597 starts up with 10,000:1 dimming even if the PWM1-3 pulse width is $1 \mu$ s. Since $V_{\text {out }}$ starts up even if PWM1-3 is low, the part achieves high dimming ratios with narrow pulse widths within a couple of PWM1-3 clock cycles.

## LED Current

Each LED string current can be individually programmed up to a maximum of 100 mA with a $2 \%$ matching accuracy between the strings. An external resistor on the $\mathrm{I}_{\text {SET1-3 }}$ pin programs the max current for that string. The CTRL1-3 pin can be used for analog dimming. Digital PWM can be programmed using the PWM1-3 pin. A dimming ratio of $10,000: 1$ can be achieved at a frequency of 100 Hz .

## Fault Protection and Reporting

The LT3597 protects against both open LED and shorted LED conditions. If the LED1-3 pin voltage exceeds 12V while the LED string is sinking current, or if the LED1-3 pin voltage is within 1.25 V of $\mathrm{V}_{\text {OUT1-3 }}$ pin voltage, the channel is disabled until the fault is removed. If the LED string opens, the LT3597 will limit the output to the voltage set by the FB resistor divider.
The LT3597 reports a fault on the FAULT pin if any of the LED strings is open or shorted. LED faults are only reported if the respective string PWM signal is high. A fault is also reported if the internal die temperature reaches the $\mathrm{T}_{\text {SET }}$ programmed derating limit.

## APPLICATIONS INFORMATION

## Inductor Selection

Inductor values between $100 \mu \mathrm{H}$ and $470 \mu \mathrm{H}$ are recommended for most applications. It is important to choose an inductor that can handle the peak current without saturating. The inductor DCR (copper wire resistance) must also be low in order to minimize $\mathrm{I}^{2} \mathrm{R}$ power losses. Table 1 lists several recommended inductors.

Table 1. Recommended Inductors

| PART | $\mathbf{L}(\boldsymbol{\mu} \mathbf{H})$ | DCR $(\boldsymbol{\Omega})$ | CURRENT <br> RATING $(\mathbf{A})$ | VENDOR |
| :--- | :---: | :---: | :---: | :--- |

| DR73 | 100 | 0.527 | 0.79 | Coiltronics |
| DR73 | 220 | 1.05 | 0.53 | www.cooperet.com |

## Capacitor Selection

Low ESR (equivalent series resistance) capacitors should be used at the outputs to minimize output ripple voltage. Use only X5R or X7R dielectrics, as these materials retain their capacitance over wider voltage and temperature ranges than other dielectrics. Table 2 lists some suggested manufacturers. Consult the manufacturers for detailed information on their entire selection of ceramic surface mount parts.

Table 2. Recommended Ceramic Capacitor Manufacturers

| Taiyo Yuden | www.t-yuden.com |
| :--- | :--- |
| AVX | www.avxcorp.com |
| Murata | www.murata.com |
| Kemet | www.kemet.com |
| TDK | www.tdk.com |

Typically $10 \mu \mathrm{~F}$ capacitors are sufficient for the $\mathrm{V}_{\text {IN }}$ and BIAS pins. The output capacitor for the buck regulators depends on the number of LEDs and switching frequency. Refer to Table 3 for the proper output capacitor selection.

Table 3. Recommended Output Capacitor Values ( $\mathrm{V}_{\text {LED }}=3.5 \mathrm{~V}$ )

| SWITCHING FREQUENCY (kHz) | \# LEDS | $\mathbf{C}_{\text {OUT }}(\boldsymbol{\mu F})$ |
| :---: | :---: | :---: |
| 1000 | $1-3$ | 3.3 |
|  | $>3$ | 2.2 |
| 500 | $1-3$ | 4.7 |
|  | $>3$ | 3.3 |
| 200 | $1-3$ | 15 |
|  | $>3$ | 6.8 |

## Diode Selection

Schottky diodes, with their low forward voltage drop and fast switching speed, must be used for all LT3597 applications. Do not use P-N junction diodes. The diode's average current rating must exceed the application's average current. The diode's maximum reverse voltage must exceed the application's input voltage. Table 4 lists some recommended Schottky diodes.

Table 4. Recommended Diodes

| CMMSH1-60 | 1 | 60 | Vishay <br> www.vishay.com |
| ESIPB | 1 | 100 |  |

## APPLICATIONS INFORMATION

## Undervoltage Lockout (UVLO)

The EN/UVLO can be used to program the input UVLO threshold by connecting it to a resistor divider from the $V_{\text {IN }}$ pin as shown in Figure 2.

Figure 2. EN/UVLO Control

Select R1 and R2 according to the following equation:

$$
V_{\operatorname{IN}(\mathrm{UVLO})}=1.51 \mathrm{~V} \cdot\left(1+\frac{\mathrm{R} 2}{\mathrm{R} 1}\right)
$$

In UVLO an internal $5.1 \mu \mathrm{~A}$ pull-down current source is connected to the pin for programmable UVLO hysteresis. The hysteresis can be set according to the following equation:

$$
\mathrm{V}_{\mathrm{UVLO}(\mathrm{HYST})}=5.1 \mu \mathrm{~A} \cdot \mathrm{R} 2
$$

Care must be taken if too much hysteresis is programmed, the pin voltage might drop too far and cause the current source to saturate.

Once the EN/UVLO pin falls below 0.4 V , the part enters into shutdown.

## Programming Maximum LED Current

Maximum LED current can be programmed by placing a resistor ( $\mathrm{R}_{\text {ISET1-3 }}$ ) between the ISET1-3 pin and ground. $R_{\text {ISET1-3 }}$ values between 20k and 100k can be chosen to set the maximum LED current between 100 mA and 20 mA respectively.
The LED current is programmed according to the following equation:

$$
I_{\text {LEDT-3 }}=2 \cdot \frac{1 V}{R_{\text {ISETT-3 }}}(\mathrm{mA})
$$

See Table 5 and Figure 3 for resistor values and corresponding programmed LED current.

Table 5. LED Current Programming

| R $_{\text {ISET1-3 }}$ VALUE (k $\boldsymbol{\Omega}$ ) | LED CURRENT (mA) |
| :---: | :---: |
| 20 | 100 |
| 25 | 80 |
| 33.3 | 60 |
| 50 | 40 |
| 100 | 20 |

Figure 3. RISET1-3 Value for LED Current

## APPLICATIONS INFORMATION

## LED Current Dimming

Two different types of dimming control are available with the LT3597. The LED current can be dimmed using the CTRL1-3 pin or the PWM1-3 pin.

For some applications, a variable DC voltage that adjusts the LED current is the preferred method for brightness control. In that case, the CTRL1-3 pin can be modulated to set the LED dimming (see Figure 4). As the CTRL1-3 pin voltage rises from 0 V to 1.0 V , the LED current increases from OmA to the maximum programmed LED current in a linear fashion. As the CTRL1-3 pin continues to increase past 1.0 V , the maximum programmed LED current is maintained. If this type of dimming control is not desired, the CTRL1-3 pin can be tied to $\mathrm{V}_{\text {REF }}$.

Figure 4. LED Current vs CTRL1-3 Voltage

Figure 5. LED Current Using PWM Dimming

For True Color PWM dimming, the LT3597 provides up to 10,000:1 PWM dimming range at 100 Hz . This is achieved by allowing the duty cycle of the PWM1-3 pinto be reduced from $100 \%$ to $0.01 \%$ for a PWM frequency of 100 Hz (see Figure 5), hence a minimum on-time of $1 \mu \mathrm{~s}$ and a maximum period of 100 ms . PWM duty cycle dimming allows for constant LED color to be maintained over the entire dimming range.

## Using the $\mathrm{T}_{\text {Set }}$ Pin for Thermal Protection

The LT3597 contains a special programmable thermal regulation loop that limits the internal junction temperature. This thermal regulation feature provides important protection at high ambient temperatures, and allows a given application to be optimized for typical, not worstcase, ambient temperatures with the assurance that the LT3597 will automatically protect itself and the LED strings under worst-case conditions.

As the ambient temperature increases, so does the internal junction temperature of the part. Once the programmed maximum junction temperature is reached, the LT3597 linearly reduces the LED current, as needed, to maintain this junction temperature. This can only be achieved when the ambient temperature stays below the maximum programmed junction temperature. Ifthe ambient temperature continues to rise above the programmed maximum junction temperature, the LED current will reduce to less than $20 \%$ of the full current.

A resistor divider from the $V_{\text {REF }}$ pin programs the maximum part junction temperature as shown in Figure 6.

Figure 6. Programming the $\mathrm{T}_{\text {SET }}$ Pin

## APPLICATIONS INFORMATION

Table 6 shows commonly used values for R1 and R2. Choose the ratio of R1 and R2 for the desired junction temperature limit as described in Figure 7.

Table 6. TSET Programmed Junction Temperature

| $\mathbf{T}_{\mathbf{j}} \mathbf{}{ }^{\circ} \mathbf{C} \mathbf{)}$ | $\mathbf{R 1} \mathbf{( k \boldsymbol { \Omega } )}$ | $\mathbf{R 2} \mathbf{( k \Omega} \mathbf{)}$ |
| :---: | :---: | :---: |
| 85 | 49.9 | 97.6 |
| 100 | 49.9 | 90.9 |
| 115 | 49.9 | 84.5 |

The $T_{\text {SET }}$ pin must be tied to $\mathrm{V}_{\text {REF }}$ if the temperature protection feature is not desired.

Figure 7. TSET Voltage for Temperature Derating

## LED Current Derating Using the CTRLM Pin

Another feature of the LT3597 is its ability to program a derating curve for maximum LED current versus temperature. LED data sheets provide curves of maximum allowable LED current versus temperature to warn against exceeding this current limit and damaging the LED. The LT3597 allows the output LEDs to be programmed for maximum allowable current while still protecting the LEDs from excessive currents at high temperature. This is achieved by programming a voltage at the CTRLM pin with a negative temperature coefficient using a resistor divider with temperature dependent resistance (Figure 8). As ambient temperature increases, the CTRLM voltage will fall below the internal 1 V voltage reference, causing LED currents to be controlled by the CTRLM pin voltage. The LED current curve breakpoint and slope versus temperature are defined by the choice of resistor ratios and use of temperature-dependent resistance in the divider for the CTRLM pin.

3597 F08

Figure 8. Programming the CTRLM Pin

## APPLICATIONS INFORMATION

Table 7 shows a list of manufacturers/distributors of NTC resistors. There are several other manufacturers available and the chosen supplier should be contacted for more detailed information. If an NTC resistor is used to indicate LED temperature, it is effective only if the resistor is placed as closely as possible to the LED strings. LED derating curves shown by manufacturers are listed for ambient temperature. The NTC resistor should have the same ambient temperature as the LEDs. Since the temperature dependency of an NTC resistor can be nonlinear over a wide range of temperatures, it is important to obtain a resistor's exact value over temperature from the manufacturer. Hand calculations of the CTRLM voltage can then be performed at each given temperature, resulting in the CTRLM versus temperature plotted curve. Iterations of resistor value calculations may be necessary to achieve the desired break point and slope of the LED current derating curve. From the CTRLM voltage, the LED current can be found using the curve shown in Figure 9.

Table 7. NTC Resistor Manufacturers/Distributors

| Murata | www.murata.com |
| :--- | :--- |
| TDK Corporation | www.tdk.com |
| Digi-Key | www.digikey.com |

If calculating the CTRLM voltage at various temperatures gives a downward slope that is too strong, use alternative resistor networks (B, C, D in Figure 8). They use temperature independent resistance to reduce the effects off the NTC resistor over temperature.

Figure 9. LED Current vs CTRLM Voltage

Murata Electronics provides a selection of NTC resistors with complete data over a wide range of temperatures. In addition, a software tool is available which allows the user to select from different resistor networks and NTC resistor values, and then simulate the exact output voltage curve (CTRLM behavior) over temperature. Referred to as the "Murata Chip NTC Thermistor Output Voltage Simulator," users can log onto www.murata.com and download the software followed by instructions for creating an output voltage $\mathrm{V}_{\text {OUT }}$ (CTRLM) from a specified $\mathrm{V}_{\text {CC }}$ supply (VReF).
The CTRLM pin must be tied to $\mathrm{V}_{\text {REF }}$ if the temperature derating function is not desired.

## Programming Switching Frequency

The switching frequency of the LT3597 can be programmed between 200 kHz and 1 MHz by an external resistor connected between the RT pin and ground. Do not leave this pin open. See Table 8 and Figure 10 for resistor values and corresponding frequencies.

Table 8. $\mathrm{R}_{\mathrm{T}}$ Resistor Selection

| SWITCHING FREQUENCY (MHz) | $\mathbf{R}_{\boldsymbol{T}}$ VALUE $(\mathbf{k} \boldsymbol{\Omega})$ |
| :---: | :---: |
| 1.0 | 33.2 |
| 0.5 | 80 |
| 0.2 | 220 |

Figure 10. Programming Switching Frequency

## APPLICATIONS INFORMATION

Selecting the optimum switching frequency depends on several factors. Inductor size is reduced with higher frequency, but efficiency drops slightly due to higher switching losses. Some applications require very low duty cycles to drive a small number of LEDs from a high supply. Low switching frequency allows a greater range of operational duty cycle and hence a lower number of LEDs can be driven. In each case, the switching frequency can be tailored to provide the optimum solution. When programming the switching frequency, the total power losses within the IC should be considered.

## Switching Frequency Synchronization

The nominal operating frequency of the LT3597 is programmed using a resistor from the RT pin to ground over a 200 kHz to 1 MHz range. In addition, the internal oscillator can be synchronized to an external clock applied to the SYNC pin. The synchronizing clock signal input to the LT3597 must have a frequency between 240 kHz and 1 MHz , a duty cycle between $20 \%$ and $80 \%$, a low state below 0.4 V and a high state above 1.6 V . Synchronization signals outside of these parameters will cause erratic switching behavior. For proper operation, an $\mathrm{R}_{\top}$ resistor is chosen to program a switching frequency $20 \%$ slower than the SYNC pulse frequency. Synchronization occurs at a fixed delay after the rising edge of SYNC.

The SYNC pin must be grounded if the clock synchronization feature is not used. When the SYNC pin is grounded, the internal oscillator controls the switching frequency of the converter.

## Operating Frequency Trade-offs

Selection of the operating frequency is a trade-off between efficiency, component size, output voltage and maximum input voltage. The advantage of high frequency operation is smaller component sizes and values. The disadvantages are lower efficiency and lower input voltage range for a desired output voltage. The highest acceptable switching frequency ( $\mathrm{f}_{\mathrm{SW}}(\mathrm{MAX})$ ) for a given application can be calculated as follows:

$$
f_{S W(\text { MAX })}=\frac{V_{D}+V_{\text {OUT }}}{\mathrm{t}_{\text {ON(MIN) }}\left(V_{D}+V_{\text {IN }}-V_{\text {SW }}\right)}
$$

where $\mathrm{V}_{\text {IN }}$ is the typical input voltage, $\mathrm{V}_{\text {OUT }}$ is the output voltage, $\mathrm{V}_{\mathrm{D}}$ is the catch diode drop $(0.5 \mathrm{~V})$ and $\mathrm{V}_{S}$ is the internal switch drop ( 0.5 V at max load). This equation shows that slower switching is necessary to accommodate high $\mathrm{V}_{\text {IN }} N_{\text {OUT }}$ ratios. The reason the input voltage range depends on the switching frequency is due to the finite minimum switch on and off times. The switch minimum on and off times are 200 ns .

## Adaptive Loop Control

The LT3597 uses an adaptive control mechanism to set the buck output voltage. This control scheme ensures maximum efficiency while not compromising minimum PWM pulse widths. When PWM1-3 is low, the output of the respective buck rises to a maximum value set by an external resistor divider to the respective FB pin. Once PWM1-3 goes high, the output voltage is adaptively reduced until the voltage across the LED current sink is 1 V . Figure 11 shows how the maximum output voltage can be set by an external resistor divider.

Figure 11. Programming Maximum $V_{0 U T 1-3}$

## APPLICATIONS INFORMATION

The maximum output voltage must be set to exceed the maximum LED drop plus 1 V by a margin greater than $10 \%$. However, this margin must not exceed a voltage of 10 V . This ensures proper adaptive loop control. The equations below are used to estimate the resistor divider ratio. The sum of the resistors should be less than 100k to avoid noise coupling to the FB pin.

$$
\begin{aligned}
& \mathrm{V}_{\text {OUT(MAX) }}=1.1\left(\mathrm{~V}_{\text {LED(MAX })}+1.1 \mathrm{~V}\right)=1.2 \mathrm{~V} \cdot\left(1+\frac{\mathrm{R} 2}{\mathrm{R} 1}\right) \\
& \mathrm{V}_{\text {OUT }(\text { MAX })}=\mathrm{V}_{\text {LED(MAX) }}+1.1 \mathrm{~V}+\mathrm{V}_{\text {MARGIN }} \\
& \mathrm{V}_{\text {MARGIN }} \leq 10 \mathrm{~V}
\end{aligned}
$$

## Minimum Input Voltage

The minimum input voltage required to generate an output voltage is limited by the maximum duty cycle and the output voltage ( $\mathrm{V}_{\text {OUT }}$ ) set by the FB resistor divider. The duty cycle is:

$$
D C=\frac{V_{D}+V_{\text {OUT }}}{V_{\text {IN }}-V_{\text {CESAT }}+V_{D}}
$$

where $V_{D}$ is the Schottky forward drop and $V_{\text {CESAT }}$ is the saturation voltage of the internal switch. The minimum input voltage is:

$$
V_{\text {IN(MIN) }}=\left(\frac{V_{D}+V_{\text {OUT(MAX) }}}{D C_{\text {MAX }}}\right)+V_{\text {CESAT }}-V_{D}
$$

where $V_{\text {OUT(MAX) }}$ is calculated from the equation in the Adaptive Loop Control section, and $\mathrm{DC}_{\text {MAX }}$ is the minimum rating of the maximum duty cycle.

## Fault Flag

The FAULT pin is an open-collector output and needs an external resistor tied to a supply. If the LED1-3 pin voltage exceeds 12 V or if the LED1-3 pin voltage is within 1.25 V of $\mathrm{V}_{\text {OUT1-3 }}$ pins while PWM1-3 is high, the FAULT pin will be pulled low. The FAULT pin will also be pulled low if the internal junction temperature exceeds the $T_{\text {SET }}$ programmed temperature limit.

There is a $3 \mu \mathrm{~s}$ delay for $\overline{\text { FAULT }}$ flag generation when the PWM1-3 signal is enabled to avoid generating a spurious flag signal. The maximum current the FAULT can sink is typically 1 mA .

## Thermal Considerations

The LT3597 provides three channels for LED strings with internal NPN devices serving as constant current sources. When LED strings are regulated, the lowest LED pin voltage is typically 1 V . More power dissipation occurs in the LT3597 at higher programmed LED currents. For 100 mA of LED current with a $100 \%$ PWM dimming ratio, at least 300 mW is dissipated within the IC due to current sources. Thermal calculations must include the power dissipation in the current sources in addition to conventional switch DC loss, switch transient loss and input quiescent loss.
In addition, the die temperature of the LT3597 must be lower than the maximum rating of $125^{\circ} \mathrm{C}$. This is generally not a concern unless the ambient temperature is above $100^{\circ} \mathrm{C}$. Care should be taken in the board layout to ensure good heat sinking of the LT3597. The maximum load current should be derated as the ambient temperature approaches $125^{\circ} \mathrm{C}$. The die temperature rise above ambient is calculated by multiplying the LT3597 power dissipation by the thermal resistance from junction to ambient. Power dissipation within the LT3597 is estimated by calculating the total power loss from an efficiency measurement and subtracting the losses of the catch diode and the inductor. Thermal resistance depends on the layout of the circuit board, but $32^{\circ} \mathrm{C} / \mathrm{W}$ is typical for the $5 \mathrm{~mm} \times 8 \mathrm{~mm}$ QFN package.

## LT3597

## APPLICATIONS INFORMATION

## Board Layout

As with all switching regulators, careful attention must be paid to the PCB board layout and component placement. To prevent electromagnetic interference (EMI) problems, proper layout of high frequency switching paths is essential. Minimize the length and area of all traces connected to the switching node pin (SW). Always use a ground plane under the switching regulator to minimize interplane coupling. Good grounding is essential in LED fault detection.

Proper grounding is also essential for the external resistors and resistor dividers that set critical operation parameters. Both the LT3597 exposed pad and pin 18 are ground. Resistors connected between ground and the CTRL1-3, CTRLM, FB1-3, $T_{\text {SET }}$ I $_{\text {SET1-3 }}$, RT and EN/UVLO pins are best tied to pin 18 and not the ground plane.
