Input/Output Pin Functions

The μPD424210 has input pins $\overline{RAS}$, $\overline{CAS}$[Note], $\overline{WE}$, $\overline{OE}$, A0 to A8 and input/output pins I/O1 to I/O16.

Pin name	Input/Output	Function
$\overline{RAS}$ (Row address strobe)	Input	$\overline{RAS}$ activates the sense amplifier by latching a row address and selecting a corresponding word line. It refreshes memory cell array of one line selected by the row address. It also selects the following function. • $\overline{CAS}$ before $\overline{RAS}$ refresh
$\overline{CAS}$ (Column address strobe)	Input	$\overline{CAS}$ activates data input/output circuit by latching column address and selecting a digit line connected with the sense amplifier.
A0 to A8 (Address inputs)	Input	Address bus. Input total 18-bit of address signal, upper 9-bit and lower 9-bit in sequence (address multiplex method). Therefore, one word is selected from 262,144-word by 16-bit memory cell array. In actual operation, latch row address by specifying row address and activating $\overline{RAS}$. Then, switch the address bus to column address and activate $\overline{CAS}$. Each address is taken into the device when $\overline{RAS}$ and $\overline{CAS}$ are activated. Therefore, the address input setup time (t_{ASR}, t_{ASC}) and hold time (t_{RAH}, t_{CAH}) are specified for the activation of $\overline{RAS}$ and $\overline{CAS}$.
$\overline{WE}$ (Write enable)	Input	Write control signal. Write operation is executed by activating $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$.
$\overline{OE}$ (Output enable)	Input	Read control signal. Read operation can be executed by activating $\overline{RAS}$, $\overline{CAS}$ and $\overline{OE}$. If $\overline{WE}$ is activated during read operation, $\overline{OE}$ is to be ineffective in the device. Therefore, read operation cannot be executed.
I/O1 to I/O16 (Data inputs/outputs)	Input/Output	16-bit data bus. I/O1 to I/O16 are used to input/output data.

Note $\overline{CAS}$ means $\overline{UCAS}$ and $\overline{LCAS}$.

Hyper Page Mode (EDO)

The hyper page mode (EDO) is a kind of page mode with enhanced features. The two major features of the hyper page mode (EDO) are as follows.

1. Data output time is extended.

In the hyper page mode (EDO), the output data is held to the next $\overline{CAS}$ cycle's falling edge, instead of the rising edge. For this reason, valid data output time in the hyper page mode (EDO) is extended compared with the fast page mode (= data extend function). In the fast page mode, the data output time becomes shorter as the $\overline{CAS}$ cycle time becomes shorter. Therefore, in the hyper page mode (EDO), the timing margin in read cycle is larger than that of the fast page mode even if the $\overline{CAS}$ cycle time becomes shorter.

2. The $\overline{CAS}$ cycle time in the hyper page mode (EDO) is shorter than that in the fast page mode.

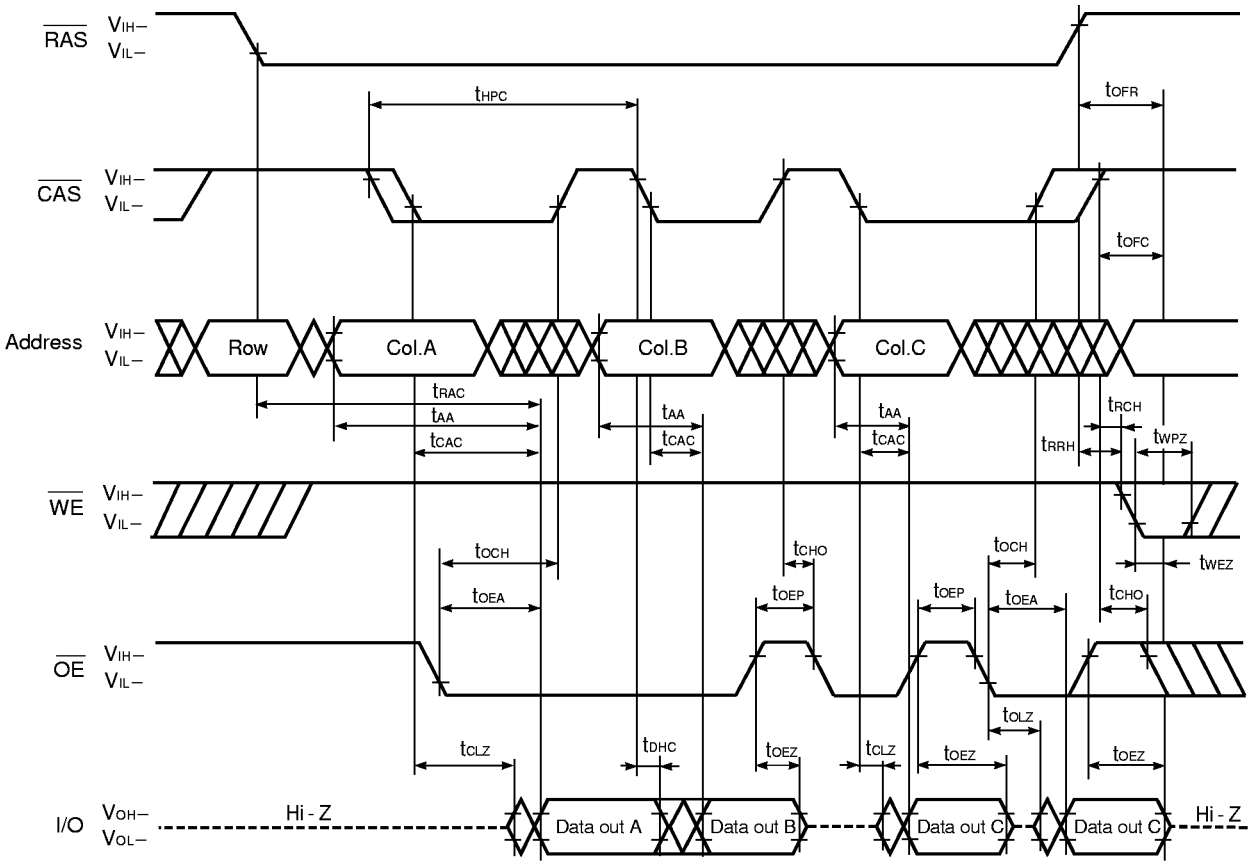
In the hyper page mode (EDO), due to the data extend function, the $\overline{CAS}$ cycle time can be shorter than in the fast page mode if the timing margin is the same.

Taking a device whose t_{RAC} is 60 ns as an example, the $\overline{CAS}$ cycle time in the fast page mode is 25 ns while that in the fast page mode is 40 ns.

In the hyper page mode (EDO), read (data out) and write (data in) cycles can be executed repeatedly during one $\overline{RAS}$ cycle. The hyper page mode (EDO) allows both read and write operations during one cycle.

The following shows a part of the hyper page mode (EDO) read cycle. Specifications to be observed are described in the next page.

Hyper Page Mode (EDO) Read Cycle



Cautions when using the hyper page mode (EDO)

1. $\overline{CAS}$ access should be used to operate t_{HPC} at the MIN. value.
2. To make I/Os to Hi-Z in read cycle, it is necessary to control $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$, $\overline{OE}$ as follows. The effective specification depends on the state of each signal.
   (1) Both $\overline{RAS}$ and $\overline{CAS}$ are inactive (at the end of read cycle)
   $\overline{WE}$: inactive, $\overline{OE}$: active
   t_{OFC} is effective when $\overline{RAS}$ is inactivated before $\overline{CAS}$ is inactivated.
   t_{OFR} is effective when $\overline{CAS}$ is inactivated before $\overline{RAS}$ is inactivated.
   The slower of t_{OFC} and t_{OFR} becomes effective.
   (2) Both $\overline{RAS}$ and $\overline{CAS}$ are active or either $\overline{RAS}$ or $\overline{CAS}$ is active (in read cycle)
   $\overline{WE}$, $\overline{OE}$: inactive ····· t_{OEZ} is effective.
   Both $\overline{RAS}$ and $\overline{CAS}$ are inactive or $\overline{RAS}$ is active and $\overline{CAS}$ is inactive (at the end of read cycle)
   $\overline{WE}$, $\overline{OE}$: active and either t_{RRH} or t_{RCH} must be met ····· t_{WEZ} and t_{WPZ} are effective.
   The faster of t_{OEZ} and t_{WEZ} becomes effective.
   The faster of (1) and (2) becomes effective.
3. In read cycle, the effective specification depends on the state of $\overline{CAS}$ signal when controlling data output with the $\overline{OE}$ signal.
   (1) $\overline{CAS}$: inactive, $\overline{OE}$: active ····· t_{CHO} is effective.
   (2) $\overline{CAS}$, $\overline{OE}$: active ····· t_{OCH} is effective.

Electrical Specifications

- $\overline{CAS}$ means $\overline{UCAS}$ and $\overline{LCAS}$.
- All voltages are referenced to GND.
- After power up ($V_{CC} \geq V_{CC(MIN.)}$), wait more than 100 μs ($\overline{RAS}$, $\overline{CAS}$ inactive) and then, execute eight $\overline{CAS}$ before $\overline{RAS}$ or $\overline{RAS}$ only refresh cycles as dummy cycles to initialize internal circuit.

Notes 1. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{RAS}$
$t_{RAD} \leq t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{RAC\ (MAX.)}$	$t_{RAC\ (MAX.)}$
$t_{RAD} > t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{AA\ (MAX.)}$	$t_{RAD} + t_{AA\ (MAX.)}$
$t_{RCD} > t_{RCD\ (MAX.)}$	$t_{CAC\ (MAX.)}$	$t_{RCD} + t_{CAC\ (MAX.)}$

$t_{RAD\ (MAX.)}$ and $t_{RCD\ (MAX.)}$ are specified as reference points only ; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC}, t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{RAD} \geq t_{RAD\ (MAX.)}$ and $t_{RCD} \geq t_{RCD\ (MAX.)}$ will not cause any operation problems.

2. $t_{CRP\ (MIN.)}$ requirement is applied to $\overline{RAS}$, $\overline{CAS}$ cycles.

Notes 1. For read cycles, access time is defined as follows:

Input conditions	Access time	Access time from $\overline{RAS}$
$t_{RAD} \leq t_{RAD\ (MAX.)}$ and $t_{RCD} \leq t_{RCD\ (MAX.)}$	$t_{RAC\ (MAX.)}$	$t_{RAC\ (MAX.)}$

$t_{RAD\ (MAX.)}$ and $t_{RCD\ (MAX.)}$ are specified as reference points only; they are not restrictive operating parameters. They are used to determine which access time (t_{RAC}, t_{AA} or t_{CAC}) is to be used for finding out when output data will be available. Therefore, the input conditions $t_{RAD} \geq t_{RAD\ (MAX.)}$ and $t_{RCD} \geq t_{RCD\ (MAX.)}$ will not cause any operation problems.

2. Either $t_{RCH\ (MIN.)}$ or $t_{RRH\ (MIN.)}$ should be met in read cycles.

Recommended Soldering Conditions

The following conditions (see tables below and next page) must be met for soldering conditions of the μPD424210.

For more details, refer to our document "SEMICONDUCTOR DEVICE MOUNTING TECHNOLOGY MANUAL" (C10535E).

Please consult with our sales offices in case other soldering process is used, or in case the soldering is done under different conditions.
