M5M29GB/T160BVP-80

16,777,216-BIT (2097,152-WORD BY 8-BIT / 1048,576-WORD BY16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

DESCRIPTION

The MITSUBISHI Mobile FLASH M5M29GB/T160BVP are 3.3V-only high speed 16,777,216-bit CMOS boot block Flash Memories with alternating BGO (Back Ground Operation) feature. The BGO feature of the device allows Program or Erase operations to be performed in one bank while the device simultaneously allows Read operations to be performed on the other bank. This BGO feature is suitable for mobile and personal computing, and communication products. The M5M29GB/T160BVP are fabricated by CMOS technology for the peripheral circuits and DINOR(Divided bit line NOR) architecture for the memory cells, and are available in in 48pin TSOP(I) .

FEATURES

- Organization ....1048,576 word x 16bit
  ....2,097,152 word x 8 bit
- Supply voltage .... Vcc = 2.7~3.6V
- Access time .... 80ns (Vcc=3.3V+/-0.3V)
  90ns (Vcc=2.7~3.6V)
- Power Dissipation
  - Read .... 54 mW (Max. at 5MHz)
  - (After Automatic Power saving) .... 0.33μW (typ.)
  - Program/Erase ....126 mW (Max.)
  - Standby .... 0.33μW (typ.)
  - Deep power down mode .... 0.33μW (typ.)
- Auto program for Bank(I)
  - Program Time ....4ms (typ.)
  - Program Unit
    - (Byte Program) 1word/1byte
    - (Page Program) 128word/256byte
- Auto program for Bank(II)
  - Program Time ....4ms (typ.)
  - Program Unit 128word/256byte
- Auto Erase
  - Erase time .... 40 ms (typ.)
  - Erase Unit
    - Bank(I) Boot Block .... 16Kword/32Kbyte x 1
    - Parameter Block .... 16Kword/32Kbyte x 7
    - Bank(II) Main Block ....32Kword/64Kbyte x 28
- Program/Erase cycles 100Kcycles
- Boot Block
  - M5M29GB160BVP .... Bottom Boot
  - M5M29GT160BVP .... Top Boot
- Other Functions
  - Soft Ware Command Control
  - Selective Block Lock
  - Erase Suspend/Resume
  - Program Suspend/Resume
  - Status Register Read
  - Alternating Back Ground Program/Erase Operation Between Bank(I) and Bank(II)
- Package
  48-Lead, 12mm x 20mm TSOP (type-I)

APPLICATION

Code Strage
Digital Cellular Phone
Telecommunication
Mobile Computing Machine
PDA (Personal Digital Assistance)
Car Navigation System
Video Game Machine

PIN CONFIGURATION (TOP VIEW)

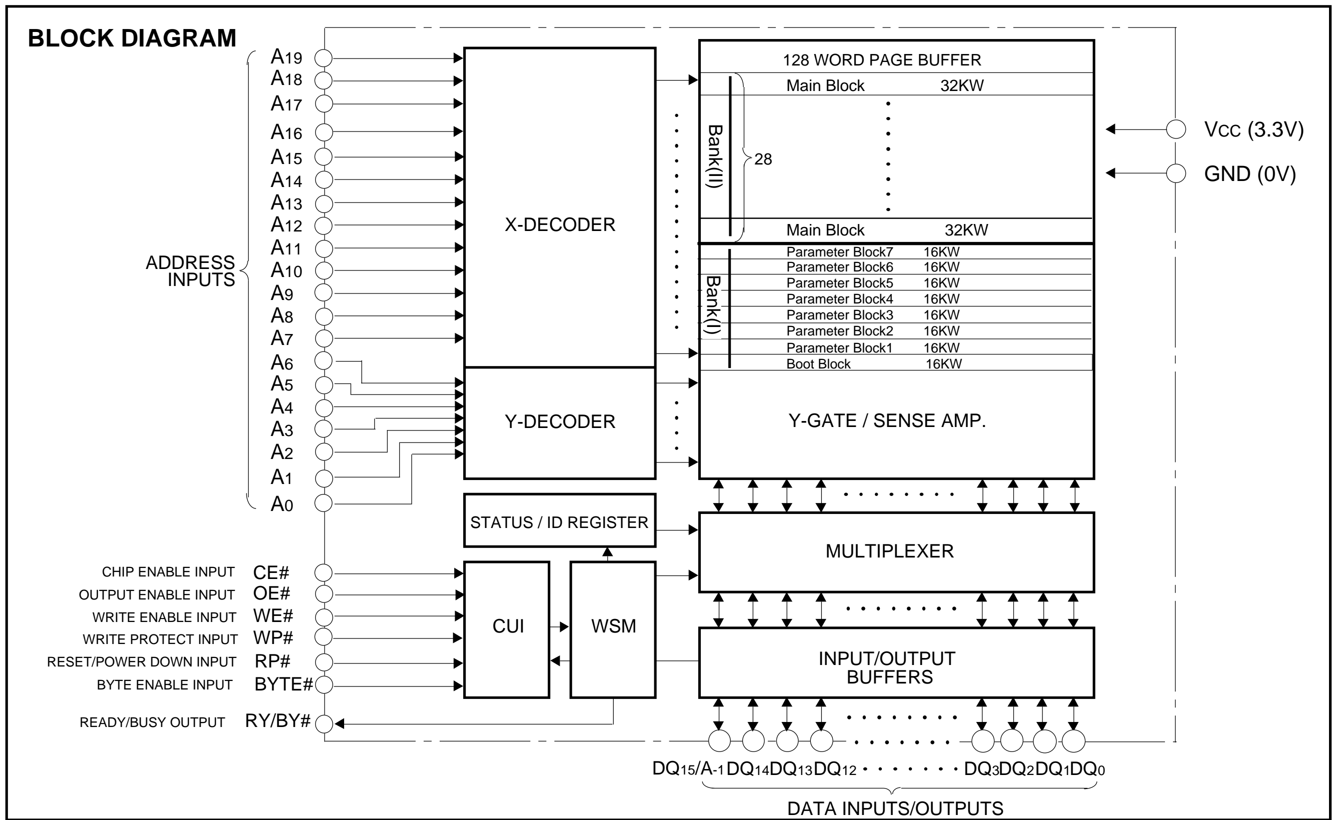
VP(Normal bend)

Sep 1999. Rev2.0



M5M29GB/T160BVP (8/16 bit version)

FUNCTION

The M5M29GB/T160BVP includes on-chip program/erase control circuitry. The Write State Machine (WSM) controls block erase and byte/page program operations. Operational modes are selected by the commands written to the Command User Interface (CUI). The Status Register indicates the status of the WSM and when the WSM successfully completes the desired program or block erase operation.
A Deep Powerdown mode is enabled when the RP# pin is at GND, minimizing power consumption.

Read
The M5M29GB/T160BVP has three read modes, which accesses to the memory array, the Device Identifier and the Status Register. The appropriate read command are required to be written to the CUI. Upon initial device powerup or after exit from deep powerdown, the M5M29GB/T160BVP automatically resets to read array mode. In the read array mode, low level input to CE# and OE#, high level input to WE# and RP#, and address signals to the address inputs (A19-A-1:Byte Mode, A19-A0:Word Mode) output the data of the addressed location to the data input/output (D7-D0:Byte Mode, D15-D0:Word Mode).

Write
Writes to the CUI enables reading of memory array data, device identifiers and reading and clearing of the Status Register. They also enable block erase and program. The CUI is written by bringing WE# to low level, while CE# is at low level and OE# is at high level. Address and data are latched on the earlier rising edge of WE# and CE#. Standard micro-processor write timings are used.

Alternating Background Operation (BGO)
The M5M29GB/T160BVP allows to read array from one bank while the other bank operates in software command write cycling or the erasing / programming operation in the background. Read array operation with the other bank in BGO is performed by changing the bank address without any additional command. When the bank address points the bank in software command write cycling or the erasing / programming operation, the data is read out from the status register. The access time with BGO is the same as the normal read operation.

Output Disable
When OE# is at VIH, output from the devices is disabled. Data input/output are in a high-impedance(High-Z) state.

Standby
When CE# is at VIH, the device is in the standby mode and its power consumption is reduced. Data input/output are in a high-impedance(High-Z) state. If the memory is deselected during block erase or program, the internal control circuits remain active and the device consume normal active power until the operation completes.

Deep Power-Down
When RP# is at VIL, the device is in the deep powerdown mode and its power consumption is substantially low. During read modes, the memory is deselected and the data input/output are in a high-impedance(High-Z) state. After return from powerdown, the CUI is reset to Read Array , and the Status Register is cleared to value 80H.
During block erase or program modes, RP# low will abort either operation. Memory array data of the block being altered become invalid.

Automatic Power-Saving (APS)
The Automatic Power-Saving minimizes the power consumption during read mode. The device automatically turns to this mode when any addresses or CE# isn't changed more than 200ns after the last alternation. The power consumption becomes the same as the stand-by mode. While in this mode, the output data is latched and can be read out. New data is read out correctly when addresses are changed.

SOFTWARE COMMAND DEFINITIONS

The device operations are selected by writing specific software command into the Command User Interface.

Read Array Command (FFH)

The device is in Read Array mode on initial device power up and after exit from deep powerdown, or by writing FFH to the Command User Interface. After starting the internal operation the device is set to the read status register mode automatically.

Read Device Identifier Command (90H)

It can normally read device identifier codes when Read Device Identifier Code Command(90H) is written to the command latch. Following the command write, the manufacturer code and the device code can be read from address 00000H and 00001H, respectively.

Read Status Register Command (70H)

The Status Register is read after writing the Read Status Register command of 70H to the Command User Interface. Also, after starting the internal operation the device is set to the Read Status Register mode automatically.
The contents of Status Register are latched on the later falling edge of OE# or CE#. So CE# or OE# must be toggled every status read.

Clear Status Register Command (50H)

The Erase Status, Program Status and Block Status bits are set to "1"s by the Write State Machine and can only be reset by the Clear Status Register command of 50H. These bits indicates various failure conditions.

Block Erase / Confirm Command (20H/D0H)

Automated block erase is initiated by writing the Block Erase command of 20H followed by the Confirm command of D0H. An address within the block to be erased is required. The WSM executes iterative erase pulse application and erase verify operation.

Program Commands

A)Word/Byte Program (40H)

Word/Byte program is executed by a two-command sequence. The Word/Byte Program Setup command of 40H is written to the Command Interface, followed by a second write specifying the address and data to be written. The WSM controls the program pulse application and verify operation. The Word/Byte Program Command is Valid for only Bank(I).

B)Page Program for Data Blocks (41H)

Page Program for Bank(I) and Bank(II) allows fast programming of 128words/256bytes of data. Writing of 41H initiates the page program operation for the Data area. From 2nd cycle to 257th cycle (Byte Mode)129th cycle (Word Mode), write data must be serially inputted. Address A6-A0,A-1 (Byte Mode) / A6-A0 (Word Mode) have to be incremented from 00H to 7FH/FFH. After completion of data loading, the WSM controls the program pulse application and verify operation.

C)Single Data Load to Page Buffer (74H)
/ Page Buffer to Flash (0EH/D0H)

Single data load to the page buffer is performed by writing 74H followed by a second write specifying the column address and data. Distinct data up to 256byte/128word can be loaded to the page buffer by this two-command sequence. On the other hand, all of the loaded data to the page buffer is programed simultaneously by writing Page Buffer to Flash command of 0EH followed by the confirm command of D0H. After completion of programing the data on the page buffer is cleared automatically.
This command is valid for only Bank(I) alike Word/Byte Program.

Clear Page Buffer Command (55H)

Loaded data to the page buffer is cleared by writing the Clear Page Buffer command of 55H followed by the Confirm command of D0H. This command is valid for clearing data loaded by Single Data Load to Page Buffer command.

Suspend/Resume Command (B0H/D0H)

Writing the Suspend command of B0H during block erase operation interrupts the block erase operation and allows read out from another block of memory. Writing the Suspend command of B0H during program operation interrupts the program operation and allows read out from another block of memory. The Bank address is required when writing the Suspend/Resume Command. The device continues to output Status Register data when read, after the Suspend command is written to it. Polling the WSM Status and Suspend Status bits will determine when the erase operation or program operation has been suspended. At this point, writing of the Read Array command to the CUI enables reading data from blocks other than that which is suspended. When the Resume command of D0H is written to the CUI, the WSM will continue with the erase or program processes.

DATA PROTECTION

The M5M29GB/T160BVP provides selectable block locking of memory blocks. Each block has an associated nonvolatile lock-bit which determines the lock status of the block. In addition, the M5M29GB/T160BVP has a master Write Protect pin (WP#) which prevents any modifications to memory blocks whose lock-bits are set to "0", when WP# is low. When WP# is high, all blocks can be programmed or erased regardless of the state of the lock-bits, and the lock-bits are cleared to "1" by erase. See the BLOCK LOCKING table on P.9 for details.

Power Supply Voltage

When the power supply voltage (Vcc) is less than V_{LKO}, Low V_{CC} Lock-Out voltage, the device is set to the Read-only mode. Regarding DC electrical characteristics of V_{LKO}, see P.10
A delay time of 2 us is required before any device operation is initiated. The delay time is measured from the time Vcc reaches Vccmin (2.7V).
During power up, RP#=GND is recommended. Falling in Busy status is not recommended for possibility of damaging the device.

MEMORY ORGANIZATION

The M5M29GB/T160BVP has one 32Kbyte boot block, seven 32Kbyte parameter blocks, for Bank(I) and twenty-eight 64Kbyte main blocks for Bank(II). A block is erased independently of other blocks in the array.

Mitsubishi 16M Flash Memory Type name

Deep Power Down		X	X	X	V_{IL}	Hi-Z	V_{OH} (Hi-Z)

1) X at RY/BY# is V_{OL} or V_{OH}(Hi-Z).
*The RY/BY# is an open drain output pin and indicates status of the internal WSM. When low,it indicates that the WSM is Busy performing an operation.
A pull-up resistor of 10K-100K Ohms is required to allow the RY/BY# signal to transition high indicating a Ready WSM condition.
2) X can be V_{IH} or V_{IL} for control pins.

SOFTWARE COMMAND DEFINITION

Command List

Command	1st bus cycle			2nd bus cycle			3rd ~257th bus cycles (Byte Mode) 3rd ~129th bus cycles (Word Mode)		
	Mode	Address	Data (DQ7-0) 1) (DQ15-0)	Mode	Address	Data (DQ7-0) (DQ15-0)	Mode	Address	Data (DQ7-0) (DQ15-0)

Device Identifier	Write	X	90H	Read	IA 2)	ID 2)			
Read Status Register	Write	Bank3)	70H	Read	Bank	SRD4)			
Clear Status Register	Write	X	50H						
Clear Page Buffer	Write	X	55H	Write	X	D0H 1)			
Byte/Word Program 5)	Write	Bank(I) 5)	40H	Write	WA 6)	WD 6)			
Page Program 7)	Write	Bank	41H	Write	WA0 7)	WD0 7)	Write	WAn 7)	WDn 7)
Single Data Load to Page Buffer 5)	Write	Bank(I) 5)	74H	Write	WA	WD			
Page Buffer to Flash 5)	Write	Bank(I) 5)	0EH	Write	WA 8)	D0H 1)			
Block Erase / Confirm	Write	Bank	20H	Write	BA 9)	D0H 1)			
Suspend	Write	Bank	B0H						
Resume	Write	Bank	D0H						
Read Lock Bit Status	Write	X	71H	Read	BA	DQ6 10)			
Lock Bit Program / Confirm	Write	Bank	77H	Write	BA	D0H 1)			
Erase All Unlocked Blocks	Write	X	A7H	Write	X	D0H 1)			

1) In the word-wide version(Byte#=H), upper byte data (DQ8-DQ15) is ignored.
2) IA=ID Code Address : A0=VIL (Manufacturer's Code) : A0=VIH (Device Code), ID=ID Code
3) Bank = Bank Address (Bank(I) or Bank(II)) : A19-A17.
4) SRD = Status Register Data
5) Byte/Word Program, Single Data Load and Page Buffer to Flash Command is valid for only Bank(I).
6) WA = Write Address,WD = Write Data
7) WA0,WAn=Write Address, WD0,WDn=Write Data.
Byte Mode : Write Address and Write Data must be provided sequentially from 00H to FFH for A6-A0,A-1. Page size is 256Byte (256byte x 8bit), and also A19-A7(Block Address, Page Address) must be valid.
Word Mode : Write Address and Write Data must be provided sequentially from 00H to 7FH for A6-A0. Page size is 128word (128word x 16bit). and also A19-A7(Block Address, Page Address) must be valid.
8) WA = Write Address : Upper page address, A19-A7(Block Address, Page Address) must be valid.
9) BA = Block Address : BA = Block Address : A19-A14(Bank1) A19-A15(Bank2)
10) DQ6 provides Block Lock Status, DQ6 = 1 : Block Unlock, DQ6 = 0 : Block Locked.

BLOCK LOCKING

160B		Lock Bit (Internally)	Write Protection Provided				Note
			BANK(I)		BANK(II)	Lock Bit	
RP#	WP#		Boot	Parameter	Data		
V_{IL}	X	X	Locked	Locked	Locked	Locked	Deep Power Down Mode
V_{IH}	V_{IL}	0	Locked	Locked	Locked	Locked	
		1	Locked	Unlocked	Unlocked	Locked	
	V_{IH}	X	Unlocked	Unlocked	Unlocked	Unlocked	All Blocks Unlocked

1) DQ_6 provides Lock Status of each block after writing the Read Lock Status command (71H).
WP# pins must not be switched during performing Erase / Write operations or WSM Busy (WSMS = 0).
2) Erase/Write command for locked blocks is aborted. At this time read mode is not array read mode but status read mode and 00B0H is read. Please issue Clear Status Register command plus Read Array command to change the mode from status read mode to array read mode.

STATUS REGISTER

Symbol	Status	Definition	
		"1"	"0"
SR.7 (DQ_7)	Write State Machine Status	Ready	Busy
SR.6 (DQ_6)	Suspend Status	Suspended	Operation in Progress / Completed
SR.5 (DQ_5)	Erase Status	Error	Successful
SR.4 (DQ_4)	Program Status	Error	Successful
SR.3 (DQ_3)	Block Status after Program	Error	Successful
SR.2 (DQ_2)	*Reserved*	-	-
SR.1 (DQ_1)	*Reserved*	-	-
SR.0 (DQ_0)	*Reserved*	-	-

*The RY/BY# is an open drain output pin and indicates status of the internal WSM. When low,it indicates that the WSM is Busy performing an operation.
A pull-up resistor of 10K-100K Ohms is required to allow the RY/BY# signal to transition high indicating a Ready WSM condition.
*DQ3 indicates the block status after the page programming, byte/word programming and page buffer to flash. When DQ3 is "1", the page has the over-programed cell . If over-program occurs, the device is block fail. However if DQ3 is "1", please try the block erase to the block. The block may revive.

DEVICE IDENTIFIER CODE

Code \ Pins	A_0	DQ_7	DQ_6	DQ_5	DQ_4	DQ_3	DQ_2	DQ_1	DQ_0	Hex. Data
Manufacturer Code	V_{IL}	0	0	0	1	1	1	0	0	1CH
Device Code (-T160BVP)	V_{IH}	1	0	1	0	0	0	0	0	A0H
Device Code (-B160BVP)	V_{IH}	1	0	1	0	0	0	0	1	A1H

In the word-wide mode, the upper data(D_{15-8}) is "0".

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Min	Max	Unit
V_{cc}	V_{cc} voltage	With respect to Ground	-0.2	4.6	V
V_{I1}	All input or output voltage 1)		-0.6	4.6	V
T_a	Ambient temperature		-40	85	°C
T_{bs}	Temperature under bias		-50	95	°C
T_{stg}	Storage temperature		-65	125	°C
I_{OUT}	Output short circuit current			100	mA

1) Minimum DC voltage is -0.5V on input/output pins. During transitions, this level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input/output pins is V_{CC}+0.5V which, during transitions, may overshoot to V_{CC}+1.5V for periods <20ns.

CAPACITANCE

Symbol	Parameter	Test conditions	Limits			Unit
			Min	Typ	Max	
C_{IN}	Input capacitance (Address, Control Pins)	Ta = 25°C, f = 1MHz, V_{in} = V_{out} = 0V			8	pF
C_{OUT}	Output capacitance				12	pF

DC ELECTRICAL CHARACTERISTICS (Ta = -40~ 85°C, Vcc = 2.7V ~ 3.6V, unless otherwise noted)

Symbol	Parameter	Test conditions		Limits			Unit
				Min	Typ1)	Max	
I_{LI}	Input leakage current	0V≤V_{IN}≤V_{CC}				±1	µA
I_{LO}	Output leakage current	0V≤V_{OUT}≤V_{CC}				±10	µA
I_{SB1}	Vcc standby current	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, CE# = RP# =WP# = V_{IH}			50	200	µA
I_{SB2}		V_{CC} = 3.6V, V_{IN}=GND or V_{CC}, CE# = RP# = WP#= V_{CC}±0.3V			0.1	5	µA
I_{SB3}	Vcc deep powerdown current	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, RP# = V_{IL}			5	15	µA
I_{SB4}		V_{CC} = 3.6V, V_{IN}=GND or V_{CC}, RP# =GND±0.3V			0.1	5	µA
I_{CC1}	Vcc read current for Word or Byte	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, CE# = V_{IL}, RP#=OE#=V_{IH}, I_{OUT} = 0mA	5MHz		8	15	mA
			1MHz		2	4	
I_{CC2}	Vcc Write current for Word or Byte	V_{CC} = 3.6V,V_{IN}=V_{IL}/V_{IH}, CE# =WE#= V_{IL}, RP#=OE#=V_{IH}				15	mA
I_{CC3}	Vcc program current	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, CE# = RP# =WP# = V_{IH}				35	mA
I_{CC4}	Vcc erase current	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, CE# = RP# =WP# = V_{IH}				35	mA
I_{CC5}	Vcc suspend current	V_{CC} = 3.6V, V_{IN}=V_{IL}/V_{IH}, CE# = RP# =WP# = V_{IH}				200	µA
V_{IL}	Input low voltage			– 0.5		0.8	V
V_{IH}	Input high voltage			2.0		Vcc+0.5	V
V_{OL}	Output low voltage	I_{OL} = 4.0mA				0.45	V
V_{OH1}	Output high voltage	I_{OH} = –2.0mA		0.85Vcc			V
V_{OH2}		I_{OH} = –100µA		Vcc–0.4			V
V_{LKO}	Low Vcc Lock-Out voltage 2)			1.5		2.2	V

All currents are in RMS unless otherwise noted.
1) Typical values at Vcc=3.3V, Ta=25°C
2) To protect against initiation of write cycle during Vcc power-up/ down, a write cycle is locked out for Vcc less than V_{LKO}.
If Vcc is less than V_{LKO}, Write State Machine is reset to read mode. When the Write State Machine is in Busy state, if Vcc is less than V_{LKO}, the alteration of memory contents may occur.

AC ELECTRICAL CHARACTERISTICS (Ta = -40 ~85°C)

Read-Only Mode

Symbol		Parameter	Limits						Unit
			Speed Item: -80						
			Vcc=3.3V+/-0.3V			Vcc=2.7~3.6V			
			Min	Typ	Max	Min	Typ	Max	
t_{RC}	t_{AVAV}	Read cycle time	80			90			ns
$t_{a\ (AD)}$	t_{AVQV}	Address access time			80			90	ns
$t_{a\ (CE)}$	t_{ELQV}	Chip enable access time			80			90	ns
$t_{a\ (OE)}$	t_{GLQV}	Output enable access time			30			30	ns
t_{CLZ}	t_{ELQX}	Chip enable to output in low-Z	0			0			ns
$t_{DF(CE)}$	t_{EHQZ}	Chip enable high to output in high Z			25			25	ns
t_{OLZ}	t_{GLQX}	Output enable to output in low-Z	0			0			ns
$t_{DF(OE)}$	t_{GHQZ}	Output enable high to output in high Z			25			25	ns
t_{PHZ}	t_{PLQZ}	RP# low to output high-Z			150			150	ns
$t_{a(BYTE)}$	$t_{FL/HQV}$	BYTE# access time			80			90	ns
t_{BHZ}	t_{FLQZ}	BYTE# low to output high-Z			25			25	ns
t_{OH}	t_{OH}	Output hold from CE#, OE#, addresses	0				0		ns
t_{BCD}	$t_{ELFL/H}$	F-CE# low to BYTE# high or low			5			5	ns
t_{BAD}	$t_{AVFL/H}$	Address to BYTE# high or low			5	0		5	ns
t_{OEH}	t_{WHGL}	OE# hold from WE# high	10			10			ns
t_{PS}	t_{PHEL}	RP# recovery to CE# low	150			150			ns

Timing measurements are made under AC waveforms for read operations.

AC ELECTRICAL CHARACTERISTICS (Ta = -40 ~85°C)

Write Mode (WE# control)

Symbol		Parameter	Limits						Unit
			Speed Item: -80						
			Vcc=3.3V+/-0.3V			Vcc=2.7~3.6V			
			Min	Typ	Max	Min	Typ	Max

t_{BLH}	t_{QVPH}	Block Lockhold from valid SRD	0			0			ns
t_{DAP}	t_{EHRH1}	Duration of auto-program operation		4	80		4	80	ms
t_{DAE}	t_{EHRH2}	Duration of auto-block erase operation		40	600		40	600	ms
t_{EHRL}	t_{EHRL}	F-CE# high to F-RY/BY# low			90			90	ns
t_{PS}	t_{PHWL}	RP# high recovery to write enable low	150			150			ns

Read timing parameters during command write operation mode are the same as during read-only operation mode.
Typical values at Vcc=3.3V, Ta=25°C

Erase and Program Performance

Parameter	Min	Typ	Max	Unit
Block Erase Time		40	600	ms
Main Block Write Time (Page Mode)		1.0	1.8	sec
Page Write Time		4	80	ms

Program Suspend Latency / Erase Suspend Time

Parameter	Min	Typ	Max	Unit
Program Suspend Latency			15	μs
Erase Suspend Time			15	μs

Please see page 19.

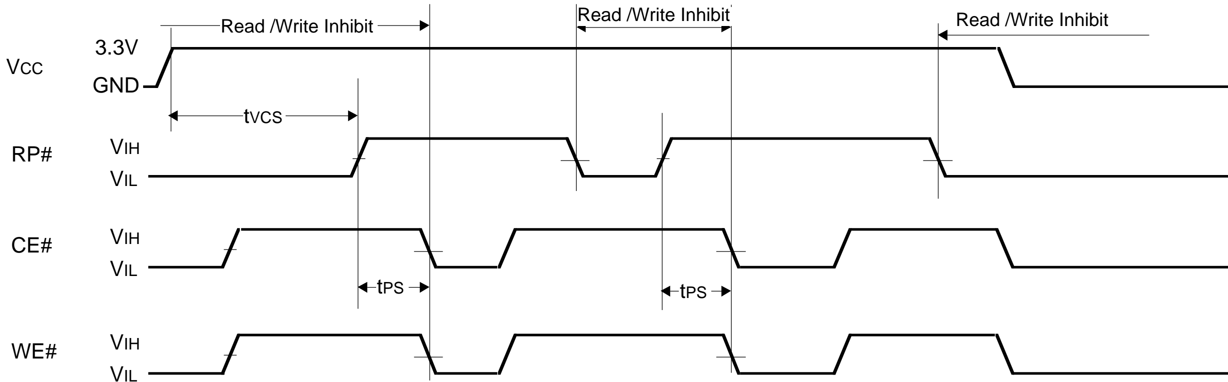
Vcc Power Up / Down Timing

Symbol	Parameter	Min	Typ	Max	Unit
t_{VCS}	RP# =V_{IH} set-up time from Vccmin	2			μs

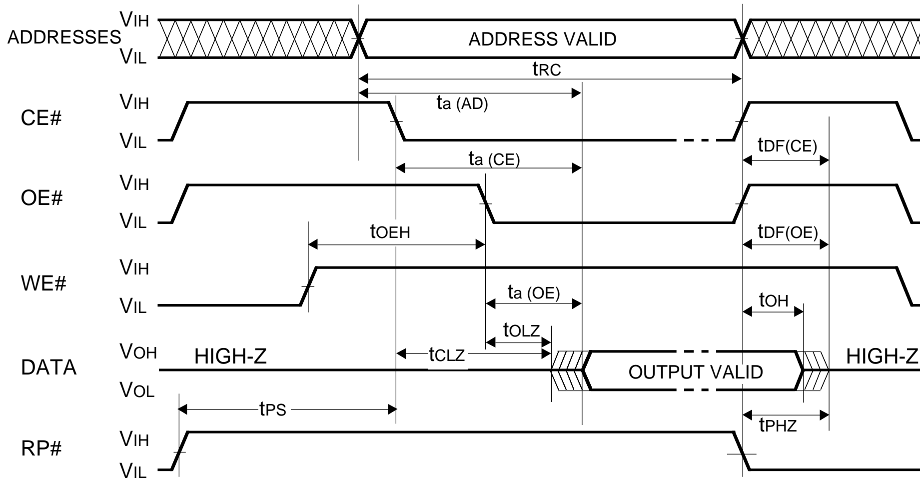
Please see page 12.

During power up/down, by the noise pulses on control pins, the device has possibility of accidental erasure or programming.
The device must be protected against initiation of write cycle for memory contents during power up/down.
The delay time of min.2μsec is always required before read operation or write operation is initiated from the time Vcc reaches Vccmin during power up/down.
By holding RP# VIL, the contents of memory is protected during Vcc power up/down.
During power up, RP# must be held VIL for min.2μs from the time Vcc reaches Vccmin.
During power down, RP# must be held VIL until Vcc reaches GND.
RP# doesn't have latch mode ,therefore RP# must be held VIH during read operation or erase/program operation.

Vcc POWER UP / DOWN TIMING



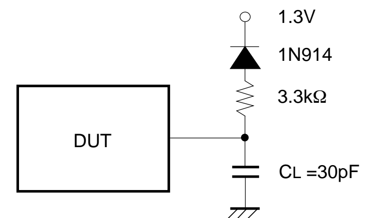
AC WAVEFORMS FOR READ OPERATION AND TEST CONDITIONS



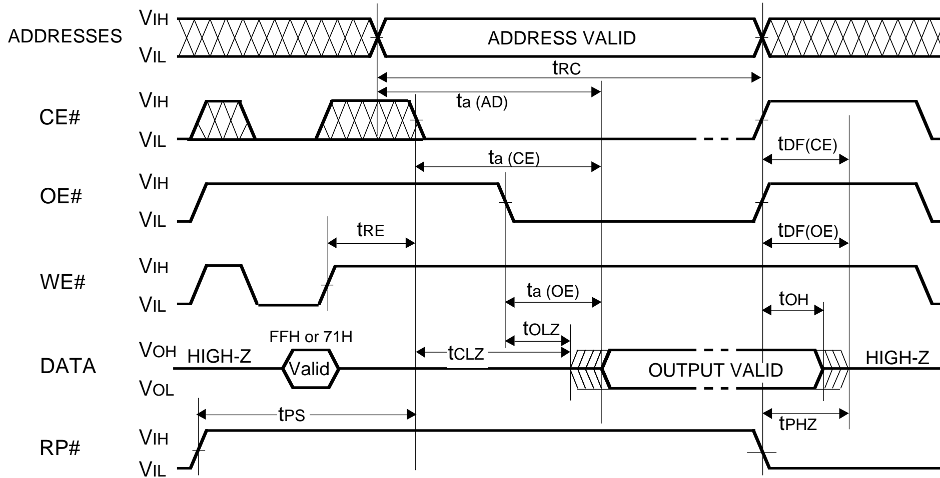
TEST CONDITIONS
FOR AC CHARACTERISTICS

Input voltage : V_{IL} = 0V, V_{IH} = 3.0V
Input rise and fall times : ≤5ns
Reference voltage
at timing measurement : 1.5V

Output load : 1TTL gate +
CL(30pF)
or

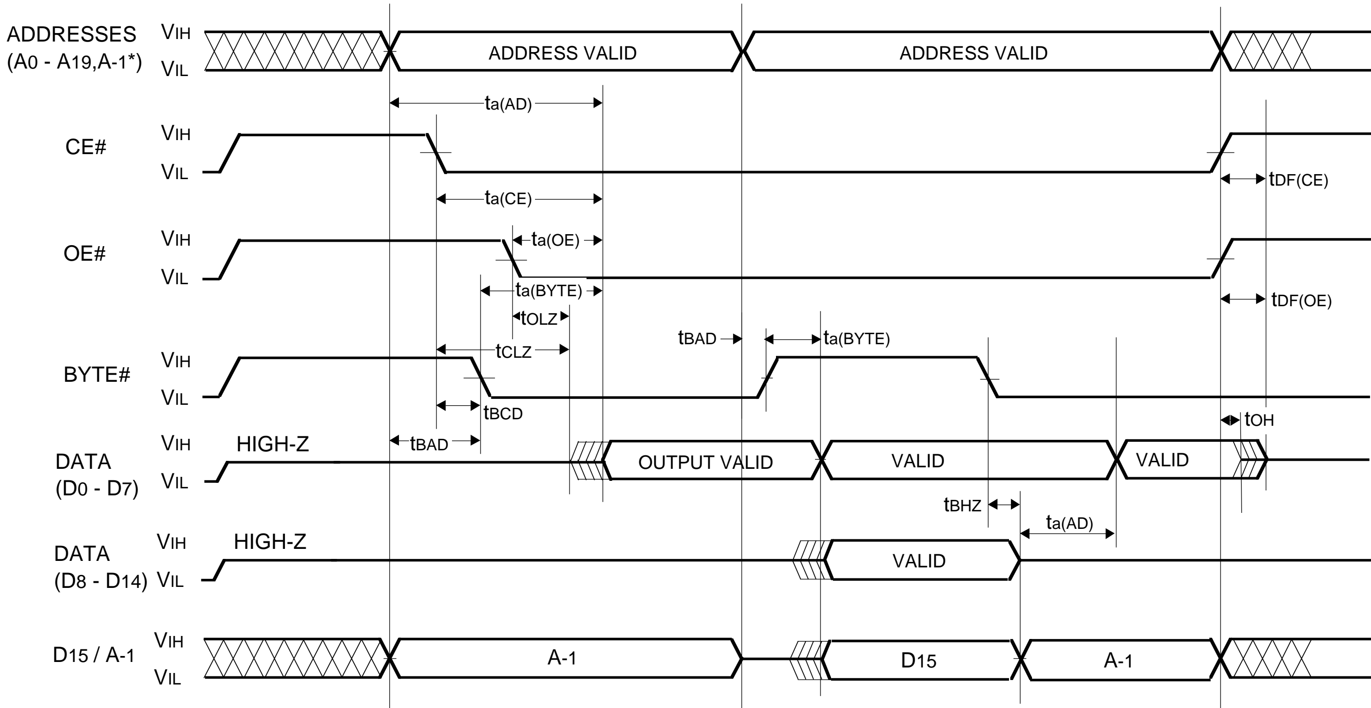


AC WAVEFORMS FOR WRITE FFH or 71H AND READ OPERATION



In the case of use CE# is Low fixed, it is allowed to define a timming specification of tRE from rising edge of WE# to falling edge of OE#, and valid data is read after spec of tRE+ta(CE). (This is only for FFH,71H program and read)

BYTE AC WAVEFORMS FOR READ OPERATION

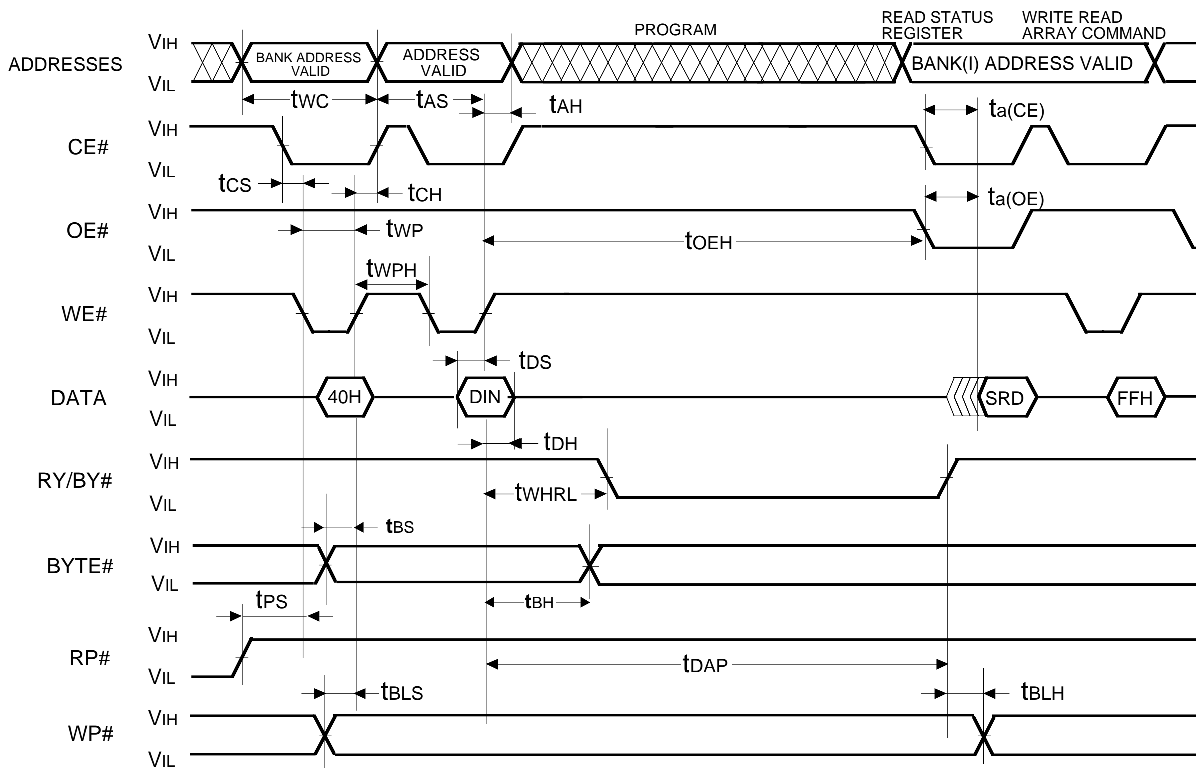


When BYTE#=VIH, CE#=OE#=VIL , D15/A-1 is output status. At this time, input signal must not be applied.

AC WAVEFORMS FOR PAGE PROGRAM OPERATION (WE# control)

AC WAVEFORMS FOR PAGE PROGRAM OPERATION (CE# control)

AC WAVEFORMS FOR BYTE / WORD PROGRAM OPERATION (WE# control) (to only BANK(I))



AC WAVEFORMS FOR BYTE / WORD PROGRAM OPERATION (CE# control) (to only BANK(I))
