

MYSON TECHNOLOGY

# 8051 Embedded Monitor Controller MTP Type

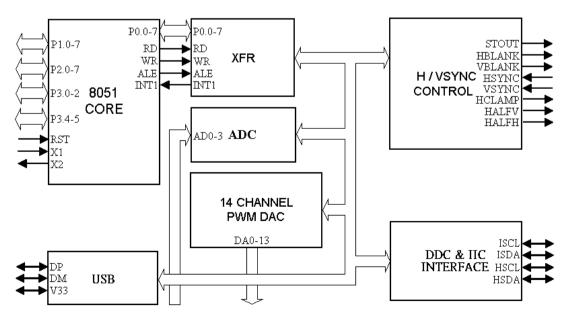

# FEATURES

- 8051 core, 12MHz operating frequency.
- 1024-byte RAM, 64K-byte program Flash-ROM.
- Maximum 14 channels of 9V open-drain PWM DAC.
- Maximum 32 bi-directional I/O pins.
- SYNC processor for composite separation/insertion, H/V polarity/frequency check, polarity adjustment and programmable clamp pulse output.
- Built-in self-test pattern generator with three free-running timings.
- Built-in low power reset circuit.
- Compliant with VESA DDC1/2B/2Bi/2B+ standard.
- Dual slave IIC addresses.
- Single master IIC interface for internal device communication.
- 4-channel 6-bit ADC.
- Watchdog timer with programmable interval.
- Compliant with Low Speed USB Spec.1.1 including 2 Endpoints: one is Control endpoint (8-byte IN & 8byte OUT FIFOs), the other one is Interrupt endpoint (8-byte IN FIFO).
- Built-in 3.3V regulator for USB Interface.
- 40-pin DIP, 42-pin SDIP or 44-pin PLCC package.

# **GENERAL DESCRIPTIONS**

The MTV212M micro-controller is an 8051 CPU core embedded device specially tailored to Monitor applications. It includes an 8051 CPU core, 1024-byte SRAM, SYNC processor, 14 built-in PWM DACs, VESA DDC interface, 4-channel A/D converter, Low Speed USB Interface and a 64K-byte internal program Flash-ROM.

## **BLOCK DIAGRAM**

This datasheet contains new product information. Myson Technology reserves the rights to modify the product specification without notice. No liability is assumed as a result of the use of this product. No rights under any patent accompany the sale of the product.

### DEVICE SUMMARY

The MTV212M is the MTP (Multi-Time Programming) type device for all of MTV212A mask ROM derivatives, the memory size and package differences please see the table below:

Part Number	USB	ROM	RAM	Package
MTV212A16	No	16K	256	PDIP40, SDIP42, PLCC44
MTV212A24	No	24K	512	PDIP40, SDIP42, PLCC44
MTV212A32	No	32K	512	PDIP40, SDIP42, PLCC44
MTV212A32U	Yes	32K	768	PDIP40, SDIP42, PLCC44
MTV212A48U	Yes	48K	768	PDIP40, SDIP42, PLCC44
MTV212A64U	Yes	64K	1024	PDIP40, SDIP42, PLCC44

The use of Auxiliary RAM (AUXRAM) is limited for targeted mask ROM, the allowable XBANK (35h) bank selection is defined as the table below:

Part Number	RAM	Xbnk2	Xbnk1	Xbnk0
MTV212A16	256	-	-	-
MTV212A24	512	0	0	0
		0	0	1
MTV212A32	512	0	0	0
		0	0	1
MTV212A32U	768	0	0	0
		0	0	1
		0	1	0
		0	1	1
MTV212A48U	768	0	0	0
		0	0	1
		0	1	0
		0	1	1
MTV212A64U	1024	0	0	0

		0	1	0
		0	1	1
		1	0	0
		1	0	1

#### Remark:

The major pin connection differences between USB (MTV212M64U) and non-USB (MTV212M64) types are pin# 4, #5 and #6 for SDIP42 and PLCC44. The pin name of USB device is V33CAP(#4), VM(#5) and VP(#6), while NC (No Connection) for non-USB device.

P2.1/AD1	I/O	22	25	25	26	General purpose I/O / ADC Input.
P2.0/AD0	I/O	23	26	26	27	General purpose I/O / ADC Input.
HSDA/P3.1/Txd	I/O	24	27	27	28	Slave IIC data / General purpose I/O / Txd.
HSCL/P3.0/Rxd	I/O	25	28	28	29	Slave IIC clock / General purpose I/O / Rxd.
P2.4/DA10	I/O	26	29	29	30	General purpose I/O / PWM DAC output (open drain).
P2.5/DA11	I/O	27	-	30	31	General purpose I/O / PWM DAC output (open drain).
P2.6/DA12	I/O	28	-	31	32	General purpose I/O / PWM DAC output (open drain).
P2.7/DA13	I/O	29	-	-	33	General purpose I/O / PWM DAC output (open drain).
DA6/P5.6	I/O	30	30	32	34	PWM DAC output / General purpose I/O (open drain).
DA7/HCLAMP	0	31	31	33	35	PWM DAC output / Hsync clamp pulse output (open drain).
VBLANK/P4.0	0	32	32	34	36	Vertical blank / General purpose Output.
HBLANK/P4.1	0	33	33	35	37	Horizontal blank / General purpose Output.
DA9/HALFV	0	34	34	36	38	PWM DAC output / Vsync half freq. output (open drain).
DA8/HALFH	0	35	35	37	39	PWM DAC output / Hsync half freq. output (open drain).
DA5/P5.5	I/O	36	36	38	40	PWM DAC output / General purpose I/O (open drain).
DA4/P5.4	0	37	37	39	41	PWM DAC output / General purpose I/O (open drain).
DA3/P5.3	0	38	38	40	42	PWM DAC output / General purpose I/O (open drain).
HSYNC		39	39	41	43	Horizontal SYNC or Composite SYNC Input.
VSYNC		40	40	42	44	Vertical SYNC input.

## FUNCTIONAL DESCRIPTIONS

#### 1.8051 CPU Core

MTV212M includes all 8051 functions with the following exceptions:

- <u>1.1</u> PSEN, ALE, RD and WR pins are disabled. The external RAM access is restricted to XFRs within the MTV212M.
- <u>1.2</u> Port0, port3.3, port3.6 and port3.7 are not general-purpose I/O ports. They are dedicated to monitor special application.
- 1.3 INT1 input pin is not provided, it is connected to special interrupt sources.
- 1.4 Port2 are shared with special function pins.

In addition, there are 2 timers, 5 interrupt sources and serial interface compatible with the standard 8051.

Note: All registers listed in this document reside in external RAM area (XFR). For internal RAM memory map please refer to 8051 spec.

#### 2. Memory Allocation

2.1 Internal Special Function Registers (SFR)

The SFR is a group of registers that are the same as standard 8051.

#### 2.2 Internal RAM

There are total 256 bytes internal RAM in MTV212M, same as standard 8052.

#### 2.3 External Special Function Registers (XFR)

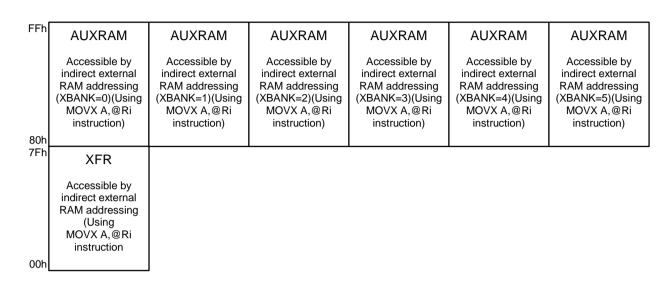

The XFR is a group of registers allocated in the 8051 external RAM area 00h - 7Fh. Most of the registers are used for monitor control or PWM DAC. Program can initialize Ri value and use "MOVX" instruction to access these registers.

#### 2.4 Auxiliary RAM (AUXRAM)

There are total 768 bytes auxiliary RAM allocated in the 8051 external RAM area 80h - FFh. The AUXRAM is divided into six banks, selected by XBANK register. Program can initialize Ri value and use "MOVX" instruction to access the AUXRAM.

FFh	Internal RAM	SFR
80h	Accessible by indirect addressing only (Using MOV A,@Ri instruction)	Accessible by direct addressing
7Fh	Internal RAM	
	Accessible by direct and indirect addressing	
00h		

#### 3. Chip Configuration

The Chip Configuration registers define the chip pins function, as well as the functional blocks' connection, configuration and frequency.

Reg name	addr	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
PADMOD	30h (w)	DA13E	DA12E	DA11E	DA10E	AD3E	AD2E	AD1E	AD0E

#### 4. Extra I/O

The extra I/O is a group of I/O pins located in XFR area. Port4 is output mode only. Port5 can be used as both output and input, because Port5's pin is open drain type, user must write Port5's corresponding bit to "1" in input mode.

Reg name	addr	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
PORT4	38h (w)						P42	P41	P40
PORT5	39h (r/w)		P56	P55	P54	P53	P52	P51	P50

**PORT4** (w) : Port 4 data output value.

**PORT5** (r/w) : Port 5 data input/output value.

#### 5. PWM DAC

Each PWM DAC converter's output pulse width is controlled by an 8-bit register in XFR. The frequency of PWM clk is 47KHz or 94KHz, selected by PWMF. And the total duty cycle step of these DAC outputs is 253 or 256, selected by DIV253. If DIV253=1, writing FDH/FEH/FFH to DAC register generates stable high output. If DIV253=0, the output will pulse low at least once even if the DAC register's content is FFH. Writing 00H to DAC register generates stable low output.

Reg name	addr	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
DA0	20h (r/w)			Puls	se width o	f PWM DA	AC 0		
DA1	21h (r/w)			Puls	se width o	f PWM DA	AC 1		
DA2	22h (r/w)			Puls	se width of	f PWM DA	AC 2		
DA3	23h (r/w)			Puls	se width o	f PWM DA	NC 3		
DA4	24h (r/w)			Puls	se width o	f PWM DA	AC 4		
DA5	25h (r/w)			Puls	se width o	f PWM DA	NC 5

DA9	29h (r/w)			Puls	se width o	f PWM DA	NC 9		
DA10	2Ah (r/w)		Pulse width of PWM DAC 10						
DA11	2Bh (r/w)		Pulse width of PWM DAC 11						
DA12	2Ch (r/w)		Pulse width of PWM DAC 12						
DA13	2Dh (r/w)			Puls	e width of	PWM DA	C 13		

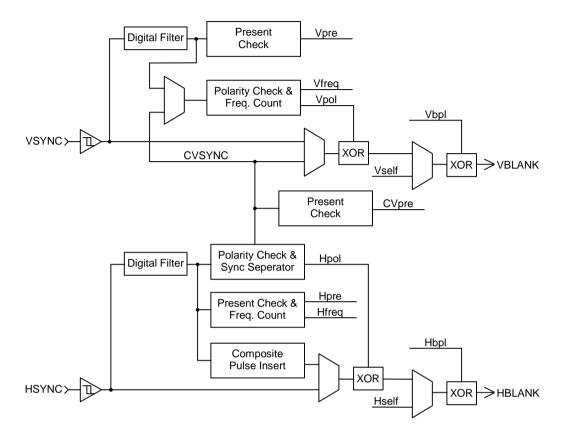

**DA0-13** (r/w) : The output pulse width control for DA0-13.

\* All of PWM DAC converters are centered with value 80h after power on.

#### 6. H/V SYNC Processing

The H/V SYNC processing block performs the functions of composite signal separation/insertion, SYNC inputs presence check, frequency counting, polarity detection and control, as well as the protection of VBLANK output while VSYNC speed up in high DDC communication clock rate. The present and frequency function block treat any pulse shorter than one OSC period as noise.

H/V SYNC Processor Block Diagram

#### 6.1 Composite SYNC separation/insertion

The MTV212M continuously monitors the input HSYNC, if the vertical SYNC pulse can be extracted from the input, a CVpre flag is set and user can select the extracted "CVSYNC" for the source of polarity check, frequency count, and VBLANK output. The CVSYNC will have 8us delay compared to the original signal. The MTV212M can also insert pulse to HBLANK output during composite VSYNC's active time. The insert pulse's width is 1/8 HSYNC period and the insertion frequency can adapt to original HSYNC.

#### 6.2 H/V Frequency Counter

MTV212M can discriminate HSYNC/VSYNC frequency and saves the information in XFRs. The 14 bits Hcounter counts the time of 64xHSYNC period, then load the result into the HCNTH/HCNTL latch. The output value will be [(128000000/H-Freq) - 1], updated once per VSYNC/CVSYNC period when VSYNC/CVSYNC is present or continuously updated when VSYNC/CVSYNC is non-present. The 12 bits Vcounter counts the time between two VSYNC pulses, then load the result into the VCNTH/VCNTL latch. The output value will be (62500/V-Freq), updated every VSYNC/CVSYNC period. An extra overflow bit indicates the condition of H/V counter overflow. The VFchg/HFchg interrupt is set when VCNT/HCNT value changes or overflow. Table 4.2.1 and table 4.2.2 shows the HCNT/VCNT value under the operations of 12MHz.

#### 6.2.1 H-Freq Table

H-	Freq(KHZ)	Output Value (14 bits)
• • •	i ieq(itiiz)	12MHz OSC (hex / dec)
1	31.5	0FDEh / 4062
2	37.5	0D54h / 3412
3	43.3	0B8Bh / 2955
4	46.9	0AA8h / 2728
5	53.7	094Fh / 2383
6	60.0	0854h / 2132
7	68.7	0746h / 1862
8	75.0	06AAh / 1706
9	80.0	063Fh / 1599
10	85.9	05D1h / 1489
11	93.8	0554h / 1364
12	106.3	04B3h / 1203

#### 6.2.2 V-Freq Table

v	-Freq(Hz)	Output value (12bits) 12MHz OSC (hex / dec)
1	56	45Ch / 1116
2	60	411h / 1041
3	70	37Ch / 892
4	72	364h / 868
5	75	341h / 833
6	85	2DFh / 735

#### 6.3 H/V Present Check

The Hpresent function checks the input HSYNC pulse, Hpre flag is set when HSYNC is over 10KHz or cleared when HSYNC is under 10Hz. The Vpresent function checks the input VSYNC pulse, the Vpre flag is set when VSYNC is over 40Hz or cleared when VSYNC is under 10Hz. The HPRchg interrupt is set when the Hpre value changes. The VPRchg interrupt is set when the Vpre/CVpre value change. However, the CVpre flag interrupt may be disabled when S/W disable the composite function.

#### 6.4 H/V Polarity Detect

The polarity functions detect the input HSYNC/VSYNC high and low pulse duty cycle. If the high pulse duration is longer than that of low pulse, the negative polarity is asserted; otherwise, positive polarity is asserted. The HPLchg interrupt is set when the Hpol value changes. The VPLchg interrupt is set when the Vpol value changes.

#### 6.5 Output HBLANK/VBLANK Control and Polarity Adjust

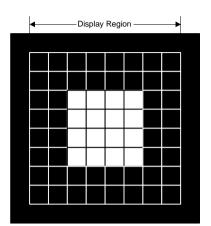

The HBLANK is the mux output of HSYNC, composite Hpulse and self-test horizontal pattern. The VBLANK is the mux output of VSYNC, CVSYNC and self-test vertical pattern. The mux selection and output polarity are S/W controllable. The VBLANK output is cut off when VSYNC frequency is over 200Hz. The HBLANK/VBLANK shares the output pin with P4.1/ P4.0.

#### 6.6 Self Test Pattern Generator

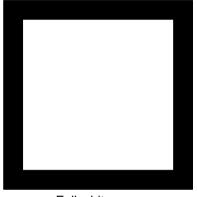

This generator can generate 4 display patterns for testing purpose, which are positive cross-hatch, negative cross-hatch, full white, and full black (showed as following figure). The HBLANK output frequency of the pattern can be chosen to 63.5KHz, 47.6KHz and 31.75KHz. The VBLANK output frequency of the pattern is 60Hz. It is originally designed to support monitor manufacturer to do burn-in test, or offer end-user a reference to check the monitor. The generator's output STOUT shares the output pin with P4.2.

#### 6.7 HSYNC Clamp Pulse Output

The HCLAMP output is active by setting "HCLPE" control bit. The HCLAMP's leading edge position, pulse width and polarity is S/W controllable.

#### 6.8 VSYNC Interrupt

The MTV212M check the VSYNC input pulse and generate an interrupt at its leading edge. The VSYNC flag is set each time when MTV212M detects a VSYNC pulse. The flag is cleared by S/W writing a "0".

EVsynd	c = 1	$\rightarrow$ Enable VSYNC interrupt.

#### 7. DDC & IIC Interface

#### 7.1 DDC1 Mode

The MTV212M enters DDC1 mode after Reset. In this mode, VSYNC is used as data clock. The HSCL pin should remain at high. The data output to the HSDA pin is taken from a shift register in MTV212M. The shift register fetch data byte from the DDC1 data buffer (DBUF) then send it in 9 bits packet formats which includes a null bit (=1) as packet separator. The DBUF set the Dbufl interrupt flag when the shift register read out the data byte from DBUF. Software needs to write EDID data to DBUF as soon as the Dbufl is set. The Dbufl interrupt is automatically cleared when Software writes a new data byte to DBUF. The Dbufl interrupt can be mask or enable by EDbufl control bit.

#### 7.2 DDC2B Mode

The MTV212M switches to DDC2B mode when it detects a high to low transition on the HSCL pin. Once MTV212M enters DDC2B mode, S/W can set IICpass control bit to allow HOST access EEPROM directly. Under such condition, the HSDA and HSCL are directly bypassed to ISDA and ISCL pins. The other way to perform DDC2 function is to clear IICpass and config the Slave A IIC block to act as EEPROM behavior. The Slave A block's slave address can be chosen by S/W as 5-bits, 6-bits or 7-bits. For example, if S/W choose 5-bits slave address as 10100b, the slave IIC block A will respond to slave address 10100xxb and save the 2 LSB "xx" in XFR. This feature enables MTV212M to meet PC99 requirement.

The MTV212M will return to DDC1 mode if HSCL is kept high for 128 VSYNC clock period. However, it will

lock in DDC2B mode if a valid IIC address (1010xxxb) has been detected on HSCL/HSDA bus. The DDC2 flag reflects the current DDC status, S/W may clear it by writing a "0" to it.

#### 7.3 Slave Mode IIC function Block

The slave mode IIC block is connected to HSDA and HSCL pins. This block can receive/transmit data using IIC protocol. There are 2 slave addresses MTV212M can respond to. S/W may write the

SLVAADR/SLVBADR register to determine the slave addresses. The SlaveA address can be configured to 5-bits, 6-bits or 7-bits by S/W setting the SlvAbs1 and SlvAbs0 control bits.

In receive mode, the block first detects IIC slave address match condition then issues a SIvAMI/SIvBMI interrupt. If the matched address is slave A, MTV212M will save the matched address's 2 LSB bits to SIvAlsb1 and SIvAlsb0 register. The data from HSDA is shifted into shift register then written to RCABUF/RCBBUF register when a data byte is received. The first byte loaded is word address (slave address is dropped). This block also generates a RCAI/RCBI (receive buffer full interrupt) every time when the RCABUF/RCBBUF is loaded. If S/W can't read out the RCABUF/RCBBUF in time, the next byte in shift register will not be written to RCABUF/RCBBUF and the slave block return NACK to the master. This feature guarantees the data integrity of communication. The WadrA/WadrB flag can tell S/W that if the data in RCABUF/RCBBUF is a word address.

In transmit mode, the block first detects IIC slave address match condition then issues a SIvAMI/SIvBMI interrupt. In the mean time, the SIvAlsb1/SIvAlsb0 is also updated if the matched address is slave A, and the data pre-stored in the TXABUF/TXBBUF is loaded into shift register, result in TXABUF/TXBBUF empty and generates a TXAI/TXBI (transmit buffer empty interrupt). S/W should write the TXABUF/TXBBUF a new byte for next transfer before shift register empty. Fail to do this will cause data corrupt. The TXAI/TXBI occurs every time when shift register reads out the data from TXABUF/TXBBUF.

The SIvAMI/SIvBMI is cleared by writing "0" to corresponding bit in INTFLG register. The RCAI/RCBI is cleared by reading RCABUF/RCBBUF. The TXAI/TXBI is cleared by writing TXABUF/TXBBUF. If the control bit ENSCL is set, the block will hold HSCL low until the RCAI/RCBI/TXAI/TXBI is cleared.

\*Please see the attachments about "Slave IIC Block Timing".

#### 7.4 Master Mode IIC Function Block

The master mode IIC block can be connected to the ISDA /ISCL pins or the HSDA/HSCL pins, select by Msel control bit. Its speed can be selected to 50KHz-400KHz by S/W setting the MIICF1/MIICF0 control bit. The software program can access the external IIC device through this interface. Since the EDID/VDIF data and the display information share the common EEPROM, precaution must be taken to avoid bus conflicting while Msel=0. In DDC1 mode or IICpass=0, the ISCL/ISDA is controlled by MTV212M only. In DDC2 mode and IICpass flag is set, the host may access the EEPROM directly. Software can test the HSCL condition by reading the Hbusy flag, which is set in case of HSCL=0, and keeps high for 100uS after the HSCL's rising edge. S/W can launch the master IIC transmit/receive by clearing the P bit. Once P=0, MTV212M will hold HSCL low to isolate the host's access to EEPROM. A summary of master IIC access is illustrated as follows.

#### 7.4.1. To write IIC Device

- 1. Write MBUF the Slave Address.
- 2. Set S bit to Start.
- 3. After the MTV212M transmit this byte, a Mbufl interrupt will be triggered.
- 4. Program can write MBUF to transfer next byte or set P bit to stop.
- \* Please see the attachments about "Master IIC Transmit Timing".

#### 7.4.2. To read IIC Device

- 1. Write MBUF the Slave Address.
- 2. Set S bit to Start.
- 3. After the MTV212M transmit this byte, a Mbufl interrupt will be triggered.
- 4. Set or reset the MAckO flag according to the IIC protocol.
- 5. Read out MBUF the useless byte to continue the data transfer.
- 6. After the MTV212M receives a new byte, the Mbufl interrupt is triggered again.
- 7. Read MBUF also trigger the next receive operation, but set P bit before read can terminate the operation.

**IICCTR** (r/w) : IIC interface control register.

DDC2 = 1	$\rightarrow$ MTV212M is in DDC2 mode, write "0" can clear it.
= 0	$\rightarrow$ MTV212M is in DDC1 mode.
MAckO = 1	$\rightarrow$ In master receive mode, NACK is returned by MTV212M.
= 0	$\rightarrow$ In master receive mode, ACK is returned by MTV212M.
S, P = ↑, 0	$\rightarrow$ Start condition when Master IIC is not during transfer.
= X, ↑	$\rightarrow$ Stop condition when Master IIC is not during transfer.
= 1, X	$\rightarrow$ Will resume transfer after a read/write MBUF operation.
= X, 0	$\rightarrow$ Force HSCL low and occupy the master IIC bus.
* A write/read MBUF	operation can be recognized only after 10us of the Mbufl flag's rising edge.

**IICSTUS** (r) : IIC interface status register.

WadrB = 1	ightarrow The data in RCBBUF is word address.
WadrA = 1	ightarrow The data in RCABUF is word address.
SIvRWB = 1	ightarrow Current transfer is slave transmit
= 0	ightarrow Current transfer is slave receive
SAckIn = 1	ightarrow The external IIC host respond NACK.
SLVS = 1	ightarrow The slave block has detected a START, cleared when STOP detected.
SlvAlsb1,SlvA	Isb0 : The 2 LSB which host send to Slave A block.
MAckIn = 1	ightarrow Master IIC bus error, no ACK received from the slave IIC device.
= 0	ightarrow ACK received from the slave IIC device.
Hifreq = 1	ightarrow MTV212M has detected a higher than 200Hz clock on the VSYNC pin.
Hbusy = 1	ightarrow Host drives the HSCL pin to low.

- **INTFLG** (w) : Interrupt flag. A interrupt event will set its individual flag, and, if the corresponding interrupt enable bit is set, the 8051 INT1 source will be driven by a zero level. Software MUST clear this register while serve the interrupt routine.
  - SIvBMI = 1  $\rightarrow$  No action.
    - $= 0 \longrightarrow Clear SlvBMI flag.$
  - SIvAMI = 1  $\rightarrow$  No action.
  - = 0  $\rightarrow$  Clear SlvAMI flag.
  - Mbufl = 1  $\rightarrow$  No action.
    - = 0  $\rightarrow$  Clear Master IIC bus interrupt flag (Mbufl).
- **INTFLG** (r) : Interrupt flag.

- TXBI = 1  $\rightarrow$  Indicates the TXBBUF need a new data byte, clear by writing TXBBUF.
- RCBI = 1  $\rightarrow$  Indicates the RCBBUF has received a new data byte, clear by reading RCBBUF.
- SIvBMI = 1  $\rightarrow$  Indicates the slave IIC address B match condition.
- TXAI = 1  $\rightarrow$  Indicates the TXABUF need a new data byte, clear by writing TXABUF.
- RCAI = 1  $\rightarrow$  Indicates the RCABUF has received a new data byte, clear by reading RCABUF.
- SIvAMI = 1  $\rightarrow$  Indicates the slave IIC address A match condition.
- Dbufl = 1  $\rightarrow$  Indicates the DDC1 data buffer need a new data byte, clear by writing DBUF.
- Mbufl = 1  $\rightarrow$  Indicates a byte is sent/received to/from the master IIC bus.
- **INTEN** (w) : Interrupt enable.

ETXBI = 1	$\rightarrow$ Enable TXBBUF interrupt.
ERCBI = 1	$\rightarrow$ Enable RCBBUF interrupt.
ESIvBMI = 1	$\rightarrow$ Enable slave address B match interrupt.
ETXAI = 1	$\rightarrow$ Enable TXABUF interrupt.
ERCAI = 1	$\rightarrow$ Enable RCABUF interrupt.
ESIvAMI = 1	$\rightarrow$ Enable slave address A match interrupt.
	Enchle DDC1 date huffer interrunt

- EDbufl = 1  $\rightarrow$  Enable DDC1 data buffer interrupt.
- EMbufI = 1  $\rightarrow$  Enable Master IIC bus interrupt.
- **Mbuf** (w) : Master IIC data shift register, after START and before STOP condition, write this register will resume MTV212M's transmission to the IIC bus.
- **Mbuf** (r) : Master IIC data shift register, after START and before STOP condition, read this register will resume MTV212M's receiving from the IIC bus.
- **RCABUF** (r) : Slave IIC block A receive data buffer.
- **TXABUF** (w) : Slave IIC block A transmit data buffer.
- SLVAADR (w) : Slave IIC block A's enable and address.

ENslvA	= 1	$\rightarrow$ Enable slave IIC block A.
	= 0	$\rightarrow$ Disable slave IIC block A.
bit6-0 :		Slave IIC address A to which the slave block should respond.
RCBBUF (r) :	Slave II	C block B receive data buffer.

**TXBBUF** (w) : Slave IIC block B transmit data buffer.

**SLVBADR** (w) : Slave IIC block B's enable and address.

- ENslvB = 1  $\rightarrow$  Enable slave IIC block B.
  - = 0  $\rightarrow$  Disable slave IIC block B.
- bit6-0 : Slave IIC address B to which the slave block should respond.

#### 8. Low Power Reset (LVR) & Watchdog Timer

When the voltage level of power supply is below 4.0V for a specific time, the LVR will generate a chip reset signal. After the power supply is above 4.0V, LVR maintain in reset state for 144 Xtal cycle to guarantee the chip exit reset condition with a stable X'tal oscillation.

The WatchDog Timer automatically generates a device reset when it is overflow. The interval of overflow is 0.25 sec x N, where N is a number from 1 to 8, and can be programmed via register WDT(2:0). The timer function is disabled after power on reset, user can activate this function by setting WEN, and clear the timer by set WCLR.

#### 9. A/D converter

The MTV212M is equipped with four 6-bit A/D converters, S/W can select the current convert channel by setting the SADC1/SADC0 bit. The refresh rate for the ADC is OSC freq./12288. The ADC compare the input pin voltage with internal VDD\*N/64 voltage (where N = 0 - 63). The ADC output value is N when pin voltage is greater than VDD\*N/64 and smaller than VDD\*(N+1)/64.

Reg name	addr	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0

<b>ADC</b> (w) :	ADC control.	
ENAD	DC = 1	$\rightarrow$

ENADC	= 1	$\rightarrow$ Enable ADC.
SADC0	= 1	$\rightarrow$ Select ADC0 pin input.
SADC1	= 1	$\rightarrow$ Select ADC1 pin input.
SADC2	= 1	$\rightarrow$ Select ADC2 pin input.
SADC3	= 1	$\rightarrow$ Select ADC3 pin input.

**ADC** (r) : ADC convert result.

#### 10. USB Engine

The USB engine includes the Serial Interface Engine (SIE), the low-speed USB I/O transceiver and the 3.3 Volt Regulator. The SIE block performs most of the USB interface function with only minimum support from S/W. Two endpoints are supported. Endpoint 0 is used to receive and transmit control (including SETUP) packets while Endpoint 1 is only used to transmit data packets.

The USB SIE handles the following USB bus activity independently:

- 1. Bitstuffing/unstuffing
- 2. CRC generation/checking
- 3. ACK/ŇAK
- 4. TOKEN type identification
- 5. Address checking
- S/W handles the following tasks:
- 1. Coordinate enumeration by responding to SETUP packets
- 2. Fill and empty the FIFOs
- 3. Suspend/Resume coordination
- 4. Verify and select DATA toggle values

#### 10.1 USB Device Address

The USBADR register stores the device address. This register is reset to all 0 after chip reset or USB bus

reset. S/W must write this register a valid value after the USB enumeration process.

#### 10.2 Endpoint 0 receive

After receiving a packet and placing the data into the Endpoint 0 receive FIFO (RC0FIFO), MTV212M updates the Endpoint 0 status register (EP0STUS) to record the receive status and then generates an Endpoint 0 receive interrupt (RC0I). S/W can read the EP0STUS register for the recent transfer information, which includes the data byte count (RC0cnt), data direction (EP0dir), SETUP token flag (EP0set) and data valid flag (RC0err). The received data is always stored into RC0FIFO and the RC0cnt is always updated for DATA packets following SETUP tokens. The data following an OUT token is written into the RC0FIFO, and the RC0cnt is updated unless Endpoint 0 STALL (EP0stall) or Endpoint 0 receive NAK (RC0nak) is set. The RC0I interrupt will happen in case where the RC0cnt/RC0FIFO is updated.

#### 10.3 Endpoint 0 transmit

After detecting a valid Endpoint 0 IN token, MTV212M automatically transmit the data pre-stored in the Endpoint 0 transmit FIFO (TX0FIFO) to the USB bus if the Endpoint 0 transmit ready flag (TX0rdy) is set and the EP0stall is cleared. The number of byte to be transmitted is base on the Endpoint 0 transmit toggle control bit (TX0tgl). The DATA0/1 token to be transmitted is base on the Endpoint 0 transmit toggle control bit (TX0tgl). After the TX0FIFO is updated, TX0rdy should be set to 1. This enables the MTV212M to respond to an Endpoint 0 IN packet. TX0rdy is cleared and an Endpoint 0 transmit interrupt (TX0I) is generated once the USB host acknowledges the data transmission. The interrupt service routine can check TX0rdy to confirm that the data transfer was successful.

#### 10.4 Endpoint 1 transmit

Endpoint 1 is capable of transmit only. This endpoint is enable when the Endpoint1 configured control bit (EP1Cfgd) is set. After detecting a valid Endpoint 1 IN token, MTV212M automatically transmit the data prestored in the Endpoint 1 transmit FIFO (TX1FIFO) to the USB bus if the Endpoint 1 transmit ready flag (TX1rdy) is set and the EP1stall is cleared. The number of byte to be transmitted is base on the Endpoint 1 transmit byte count register (TX1cnt). The DATA0/1 token to be transmitted is base on the Endpoint 1 transmit toggle control bit (TX1tgl). After the TX1FIFO is updated, TX1rdy should be set to 1. This enables the MTV212M to respond to an Endpoint 1 IN packet. TX1rdy is cleared and an Endpoint 1 transmit interrupt (TX1I) is generated once the USB host acknowledges the data transmission. The interrupt service routine can check TX0rdy to confirm that the data transfer was successful.

#### 10.5 USB Control and Status

Other USB control bits include the USB enable (ENUSB), SUSPEND (Susp), RESUME (RsmO), Control Read (CtrRD), and corresponding interrupt enable bits. The CtrRD should be set when program detects the current transfer is an Endpoint0 Control Read Transfer. Once this bit is set, the MTV212M will stall an Endpoint0 OUT packet with DATA toggle 0 or byte count other than 0. Other USB status flag includes the USB reset interrupt (USBrstI), RESUME interrupt (RsmI), and USB bus active flag (USBactv). The USBactv flag is set once the MTV212M detect the USB bus activity. S/W should read and clear it every 3 ms to identify the suspend condition. Writing a "1" to the USBactv flag will not change its value.

#### 10.6 Suspend and Resume

Once the Suspend condition is asserted, S/W can set the Susp bit to stop the USBSIE's clock. In the mean time, the 3.3V Regulator is operating in low power mode. S/W can further save the device power by force the 8051 CPU core into the Power Down or Idle mode by setting the PCON register in SFR area. In the Idel mode, the X'tal keeps oscillating and CPU can be waken-up by the trigger of any enabled interrupt. In the Power Down mode, the X'tal is stop, but CPU can be waken-up by the trigger of enabled INT1's source. In short, S/W can keep the RsmI alive before enter the suspend mode.

# **Test Mode Condition**

In normal application, users should avoid the MTV212M entering its test/program mode, outlined as follow: Test Mode A: RESET=1 & DA9=1 & DA8=0 & STO=0 Test Mode B: RESET's falling edge & DA9=1 & DA8=0 & STO=1

Program Mode: RESET=1 & DA9=0 & DA8=1

#### **ELECTRICAL PARAMETERS**

#### 1. Absolute Maximum Ratings

#### at: Ta= 0 to 70 <sup>o</sup>C, VSS=0V

Name	Symbol	Range	Unit
Maximum Supply Voltage	VDD	-0.3 to +6.0	V
Maximum Input Voltage	Vin	-0.3 to VDD+0.3	V
Maximum Output Voltage	Vout	-0.3 to VDD+0.3	V
Maximum Operating Temperature	Topg	0 to +70	٥C
Maximum Storage Temperature	Tstg	-25 to +125	оС

#### 2. Allowable Operating Conditions

at: Ta= 0 to 70 <sup>o</sup>C, VSS=0V

Name	Symbol	Min.	Max.	Unit
Supply Voltage	VDD	4.5	5.5	V
Input "H" Voltage	Vih1	0.4 x VDD	VDD +0.3	V
Input "L" Voltage	Vil1	-0.3	0.2 x VDD	V
Operating Freq.	Fopg	-	15	MHz

#### 3. DC Characteristics

Name	Symbol	Condition	Min.	Тур.	Max.	Unit
Output "H" Voltage, open drain pin	Voh1	loh=0uA	4			V
Output "H" Voltage, 8051 I/O port pin	Voh2	loh=-50uA	4			V
Output "H" Voltage, pin HBLANK, VBLANK, STOUT	Voh3	loh=-2mA	4			V
Output "L" Voltage	Vol	lol=6mA			0.45	V
		Active		18	24	mA
Power Supply Current	ldd	Idle		1.3	4.0	mA
		Power-Down		50	80	uA
RST Pull-Down Resistor	Rrst	VDD=5V	50		150	Kohm
Pin Capacitance	Cio				15	рF

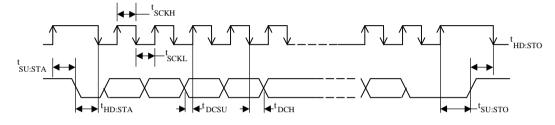

#### 4. AC Characteristics

at: Ta=0 to 70 $^{\circ}$ C	VDD=5.0V, VSS=0V
$a_1 \cdot a_{-0} \cdot 0 \cdot 0$	

Name	Symbol	Condition	Min.	Тур.	Max.	Unit
Crystal Frequency	fXtal			12		MHz
PWM DAC Frequency	fDA	fXtal=12MHz	46.875		94.86	KHz
HS input pulse Width	tHIPW	fXtal=12MHz	0.3		8	uS
VS input pulse Width	tVIPW	fXtal=12MHz	3			uS
HSYNC to Hblank output jitter	tHHBJ				5	nS
H+V to Vblank output delay	tVVBD	fXtal=12MHz		10		uS
VS pulse width in H+V signal	tVCPW	FXtal=12MHz	20			uS
SDA to SCL setup time	tDCSU		200			ns

SDA to SCL hold time	tDCH	100	ns
SCL high time	tSCLH	500	ns
SCL low time	tSCLL	500	ns
START condition setup time	tSU:STA	500	ns
START condition hold time	tHD:STA	500	ns
STOP condition setup time	tSU:STO	500	ns
STOP condition hold time	tHD:STO	500	ns

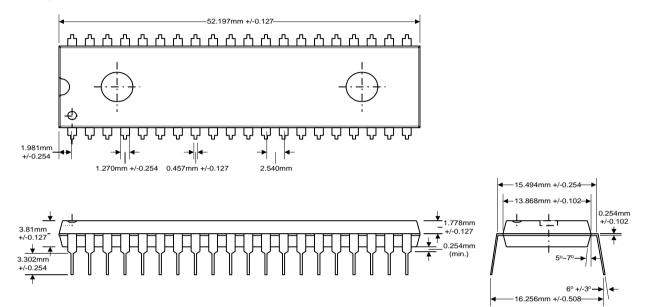

Data interface timing (I<sup>2</sup>C)

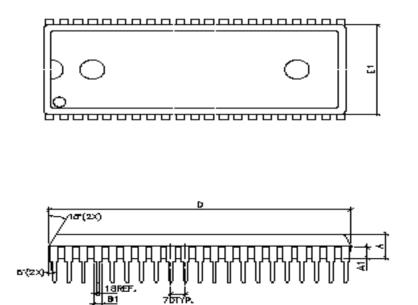

#### PACKAGE DIMENSION

#### 1. 40-pin PDIP 600 mil

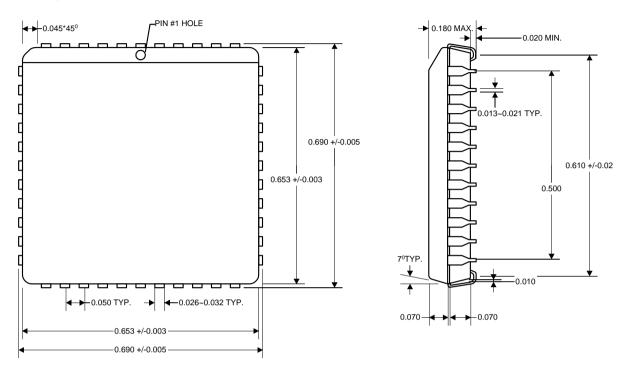

#### 2. 42 pin SDIP Unit: mm

Sumbol	Dimension in mm					
Symbol	Min	Nom	Max			
Α	3.937	4.064	4.2			
A1	1.78	1.842	1.88			
B1	0.914	1.270	1.118			
D	36.78	36.83	36.88			
E1	13.945	13.970	13.995			
F	15.19	15.240	15.29			
eB	15.24	16.510	17.78			
θ	0°	7.5°	15°
