

M5M5V1132FP,GP-6,-7,-8,-7L,-8L

1048576-BIT(32768-WORD BY 32-BIT) SYNCHRONOUS BURST SRAM

DESCRIPTION

The M5M5V1132 is a family of 1M bit synchronous SRAMs organized as 32768-words of 32-bit. The M5M5V1132 provides a high speed secondary cache solution for microprocessors. The design integrates a 2-bit burst counter, input and output registers with the ultra fast 1M bit SRAM on a single monolithic circuit. This design reduces component count of cache data RAM solutions. Mitsubishi's SRAMs are fabricated with high-performance, low power CMOS technology, providing greater reliability. This device operates on a single 3.3V power supply and are directly LVTTTL compatible.

FEATURES

- Access times /Cycle times

M5M5V1132FP,GP-6	5.5ns/10.0ns (100MHz)
M5M5V1132FP,GP-7, -7L	7.0ns/13.3ns (75MHz)
M5M5V1132FP,GP-8, -8L	8.0ns/15.0ns (66MHz)
- Low power dissipation

Active (66MHz)	415mW (typ)
Stand-by (-6, -7, -8)	0.7mW (typ)
Stand-by (-7L, -8L)	20μW (typ)
- Package

100pin QFP, LQFP, Body Size (14.0×20.0 mm ²)
Pin Pitch (0.65 mm)
- Single 3.3V power supply (3.13 ~ 3.60V)
- Fully registered inputs and outputs (Pipeline operation)
- Global write control or individual byte write control
- MODE pin allows either liner or interleaved burst
- Snooze mode pin (ZZ) for power down
- CLK stopped stand by mode.
- 32-bit wide data I/O

APPLICATION

486/Pentium™/PowerPC™ processor second level caches

FUNCTION

Synchronous circuitry allows for precise cycle control triggered by a positive edge clock transition. Synchronous signals include : all addresses, all data inputs, all chip selects (\overline{S}_1 , \overline{S}_2 , S_2), burst control inputs (\overline{ADSC} , \overline{ADSP} , \overline{ADV}) and write enables (\overline{MBW} , \overline{GW} , \overline{BW}_1 , \overline{BW}_2 , \overline{BW}_3 , \overline{BW}_4). \overline{S}_2 and S_2 provide easy depth expansion.

The write operation can be performed by two methods. The global write enable (\overline{GW}) will perform a write to all 32 bits. Byte wide writes are controlled by the master byte write enable (\overline{MWB}) and the 4 individual byte write enables (\overline{BW}_1 ~ \overline{BW}_4). The byte write cycle will write from one to four bytes. The write cycle is internally self-timed, eliminating the complex signal generation of an off chip write.

Asynchronous signals are output enable (\overline{OE}), snooze mode pin (ZZ) and clock (CLK). The HIGH input of ZZ pin puts the SRAM in the power-down state. When ZZ is pulled to LOW, the SRAM normally operates after 30ns of the wake up period.

When CLK is stopped and all inputs (Address, Burst control, CLK etc.) are fixed in CMOS level, the SRAM becomes in the power-down state that is called "CLK stopped stand-by mode". During CLK stopped stand-by mode, power supply current is almost same as snooze mode even if the SRAM is selected. When CLK is active again, the SRAM immediately recovers from CLK stopped stand-by mode to normal operation mode.

The burst mode control (MODE), and the flow-through enable (\overline{FT}) are DC operated pins. MODE pin will allow the choice of either an interleaved burst, or a linear burst. \overline{FT} pin normally is pulled HIGH. When \overline{FT} is pulled LOW, the SRAM changes non-pipelined type with flow-through output. \overline{FT} LOW input is only used for a test mode.

The burst operation is initiated by either address status processor (\overline{ADSP}) or address status controller (\overline{ADSC}). The burst advance pin (\overline{ADV}) controls subsequent burst addresses.

PIN FUNCTIONS

Pin	Name	Function
A ₀ ~A ₁₄	Synchronous Address Inputs	These inputs are registered and must meet the setup and hold times around the rising edge of CLK.
MBW	Synchronous Master Byte Write Enables	This active LOW input is used to enable the individual byte write operation. The individual byte write operation is performed when MBW is LOW and \overline{GW} is HIGH. The global write operation (a write to all 32 bits) is performed when \overline{GW} is LOW.
\overline{GW}	Synchronous Global Write Enables	This active LOW input is used to enable the global write operation (a write to all 32 bits) and must meet the setup and hold times around the rising edge of CLK.
$\overline{BW}_1, \overline{BW}_2, \overline{BW}_3, \overline{BW}_4$	Synchronous Byte Write Enables	These active LOW inputs allow individual bytes to be written and must meet the setup and hold times around the rising edge of CLK. A byte write enables is LOW for a WRITE cycle and HIGH for a READ cycle. \overline{BW}_1 controls DQ ₁ ~DQ ₈ . \overline{BW}_2 controls DQ ₉ ~DQ ₁₆ . \overline{BW}_3 controls DQ ₁₇ ~DQ ₂₄ . \overline{BW}_4 controls DQ ₂₅ ~DQ ₃₂ . Data I/O are tristated if any of these four inputs are LOW.
CLK	Clock Input	This signal latches the address, data, chip enables, byte write enables and burst control inputs on its rising edge. All synchronous inputs must meet setup and hold times around the clock's rising edge.
\overline{S}_1	Synchronous Chip Select Input	This active LOW input is used to enable the device and conditions internal use of \overline{ADSP} . This input is sampled only when a new external address is loaded.
\overline{S}_2	Synchronous Chip Select Input	This active LOW input is used to enable the device. This input is sampled only when a new external address is loaded. This input can be used for memory depth expansion.
S ₂	Synchronous Chip Select Input	This active HIGH input is used to enable the device. This input is sampled only when a new external address is loaded. This input can be used for memory depth expansion.
\overline{OE}	Output Enable Input	This active LOW asynchronous input enables the data I/O output drivers.
DQ ₁ ~DQ ₃₂	Data I/O	Byte 1 is DQ ₁ ~DQ ₈ ; Byte 2 is DQ ₉ ~DQ ₁₆ ; Byte 3 is DQ ₁₇ ~DQ ₂₄ ; Byte 4 is DQ ₂₅ ~DQ ₃₂ . Input data must meet setup and hold times around the rising edge of CLK.
ZZ	Snooze Mode Input	This asynchronous input allows the selection either normal operation mode or snooze mode that the SRAM is in the powerdown state even if CLK is operated. This active HIGH asynchronous input puts the SRAM in the snooze mode. When ZZ=HIGH, input leak current flows to this pin. When this pin is pulled to LOW or NC, the SRAM normally operates.
MODE	Burst Mode Control	This DC operated pin allows the choice of either a interleaved burst or a linear burst. If this pin is HIGH or NC, an interleaved burst occurs. When this pin is tied LOW, a linear burst occurs, and input leak current flows.
\overline{FT}	Flow-through Enable	This DC operated pin is used as a test mode pin. Normally, this pin is pulled HIGH or NC. When this pin is tied LOW, the SRAM changes non-pipelined type with flow-through output, and input leak current flows.
\overline{ADSP}	Synchronous Address Status Processor	This active LOW input interrupts any ongoing burst, causing a new external address to be latched. A READ is performed using the new address, independent of the byte write enables and \overline{ADSC} but dependent upon S ₂ and \overline{S}_2 . \overline{ADSP} is ignored if \overline{S}_1 is HIGH. Power-down state is entered if S ₂ is LOW or \overline{S}_2 is HIGH.
\overline{ADSC}	Synchronous Address Status Controller	This active LOW input interrupts any ongoing burst and causes a new external address to be latched. A READ or WRITE is performed using the new address if all chip enables are active. Power-down state is entered if one or more chip enables are inactive.
\overline{ADV}	Synchronous Address Advance	This active LOW input is used to advance the internal burst counter, controlling burst access after the external address is loaded. A HIGH on this pin effectively causes wait states to be generated (no address advance). This pin must be HIGH at the rising edge of the first clock after an \overline{ADSP} cycle is initiated if a WRITE cycle is desired (to ensure use of correct address)
Vcc	Vcc	Power Supply (3.3V)
Vss	Vss	Ground (0V)
VccQ	VccQ	I/O Buffer Supply (3.3V)
VssQ	VssQ	I/O Buffer Ground (0V)

M5M5V1132FP,GP-6,-7,-8,-7L,-8L**1048576-BIT(32768-WORD BY 32-BIT) SYNCHRONOUS BURST SRAM****DC OPERATED TRUTH TABLE**

Name	Input status	Operation
MODE	H or NC	Interleaved Burst Sequence
	L	Linear Burst Sequence
FT	H or NC	Pipelined SRAM
	L	Non-pipelined SRAM (Test mode)

Note 1. MODE and FT are DC operated pins.

2. H means logic HIGH or NC. L means logic LOW. NC means No-Connection

3. Normally, FT is pulled to HIGH or NC. FT LOW input is only used for a test mode.

4. See BURST SEQUENCE TABLE about Interleaved and Linear Burst Sequence.

BURST SEQUENCE TABLE

Interleaved Burst Sequence (when MODE = HIGH or NC)

Operation	A ₁₄ -A ₂	A ₁	A ₀
First access, latch external address	A ₁₄ -A ₂	A ₁	A ₀
Second access (first burst address)	latched A ₁₄ -A ₂	latched A ₁	latched A ₀
Third access (second burst address)	latched A ₁₄ -A ₂	latched A ₁	latched A ₀
Fourth access (third burst address)	latched A ₁₄ -A ₂	latched A ₁	latched A ₀

Linear Burst Sequence (when MODE = LOW)

Operation	A ₁₄ -A ₂	A ₁ , A ₀			
First access, latch external address	A ₁₄ -A ₂	0, 0	0, 1	1, 0	1, 1
Second access (first burst address)	latched A ₁₄ -A ₂	0, 1	1, 0	1, 1	0, 0
Third access (second burst address)	latched A ₁₄ -A ₂	1, 0	1, 1	0, 0	0, 1
Fourth access (third burst address)	latched A ₁₄ -A ₂	1, 1	0, 0	0, 1	1, 0

Note 5. The burst sequence wraps around to its initial state upon completion.

SYNCHRONOUS TRUTH TABLE

S ₁	S ₂	S ₂	ADSP	ADSC	ADV	Write	CLK	Address used	Operation
H	X	X	X	L	X	X	L-H	None	Deselected Cycle, Power-down
L	X	L	L	X	X	X	L-H	None	Deselected Cycle, Power-down
L	H	X	L	X	X	X	L-H	None	Deselected Cycle, Power-down
L	X	L	X	L	X	X	L-H	None	Deselected Cycle, Power-down
L	H	X	X	L	X	X	L-H	None	Deselected Cycle, Power-down
L	L	H	L	X	X	X	L-H	External	READ Cycle, Begin Burst
L	L	H	H	L	X	L	L-H	External	WRITE Cycle, Begin Burst
L	L	H	H	L	X	H	L-H	External	READ Cycle, Begin Burst
X	X	X	H	H	L	H	L-H	Next	READ Cycle, Continue Burst
H	X	X	X	H	L	H	L-H	Next	READ Cycle, Continue Burst
X	X	X	H	H	L	L	L-H	Next	WRITE Cycle, Continue Burst
H	X	X	X	H	L	L	L-H	Next	WRITE Cycle, Continue Burst
X	X	X	H	H	H	H	L-H	Current	READ Cycle, Suspend Burst
H	X	X	X	H	H	H	L-H	Current	READ Cycle, Suspend Burst
X	X	X	H	H	H	L	L-H	Current	WRITE Cycle, Suspend Burst
H	X	X	X	H	H	L	L-H	Current	WRITE Cycle, Suspend Burst

Note 6. X means "don't care". H means logic HIGH. L means logic LOW.

7. Write = L means "WRITE" operation in WRITE TRUTH TABLE.

Write = H means "READ" operation in WRITE TRUTH TABLE.

8. All inputs in this table must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.

9. ADSP LOW always initiates an internal READ at the L-H edge of CLK.

10. Operation finally depends on status of asynchronous input pins (ZZ and OE).

See ASYNCHRONOUS TRUTH TABLE.

M5M5V1132FP,GP-6,-7,-8,-7L,-8L

1048576-BIT(32768-WORD BY 32-BIT) SYNCHRONOUS BURST SRAM

WRITE TRUTH TABLE

\overline{GW}	\overline{MBW}	\overline{BW}_1	\overline{BW}_2	\overline{BW}_3	\overline{BW}_4	Operation
H	H	X	X	X	X	READ
H	L	H	H	H	H	READ
H	L	L	H	H	H	WRITE BYTE 1
H	L	H	L	H	H	WRITE BYTE 2
H	L	H	H	L	H	WRITE BYTE 3
H	L	H	H	H	L	WRITE BYTE 4
H	L	L	L	H	H	WRITE BYTE1 and 2
H	L	H	H	L	L	WRITE BYTE3 and 4
H	L	L	L	L	L	WRITE ALL BYTE
L	X	X	X	X	X	WRITE ALL BYTE

Note 11. X means "don't care". H means logic HIGH. L means logic LOW.

12. All inputs in this table must meet setup and hold times around the rising edge (LOW to HIGH) of CLK.

ASYNCHRONOUS TRUTH TABLE

ZZ	\overline{OE}	Operation of synchronous truth table	Operation	I/O Status
H	X	X	Snooze mode	High-Z
L or NC	L	READ	READ	Q
L or NC	H	READ	READ	High-Z
L or NC	X	WRITE	WRITE	High-Z - D
L or NC	X	Deselected	Deselected	High-Z

Note 13. For a write operation following a read operation, \overline{OE} must be HIGH before the input data required setup time and held HIGH through the input data hold time.

14. In I/O STATUS, Q means output data during a read cycle, and D means input data during a write cycle.
15. "Snooze mode" means power down state of which stand-by current does not depend on cycle time.
16. "Deselected" means power down state of which stand-by current depends on cycle time.
17. When ZZ is pulled to LOW, the SRAM normally operates after 30ns of the wake up period.

1048576-BIT(32768-WORD BY 32-BIT) SYNCHRONOUS BURST SRAM

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Conditions	Ratings	Unit
V _{CC}	Power supply voltage	With respect to GND	-2.0* ~ 4.6	V
