SCHEMATIC

POWER RATING

RATED POWER AT 70°C, TC164 = I/16W FOR ELEMENT

RATED VOLTAGE:

The DC or AC (rms) continuous working voltage corresponding to the rated power is determined by the following formula:

$$V=\sqrt{(P \times R)}$$

Where

V=Continuous rated DC or AC (rms) working voltage (V)

P=Rated power (W)

R=Resistance value (Ω)

Temperature Coefficient of Resistance (T.C.R.)	Measure resistance at +25°C or specified room temperature as R ₁ , then measure at -55°C or +155°C respectively as R ₂ . Determine the temperature coefficient of resistance from the following formula:	T.C.R. = $\frac{R_2-R_1}{R_1(t_2-t_1)} \times 10^6 \text{ (ppm/°C)}$ Where $t_1=+25^{\circ}\text{C or specified room temperature}$		Refer to table 2		
Thermal Shock	At $-55\pm3^{\circ}$ C for 2 minutes and at $+155\pm2^{\circ}$ C for 2 minutes as one cycle. After 5 cycles, the specimen shall be stabilized at room temp. Measure the resistance to determine Δ R/R(%) after one more hour.			±(1.0%+0.05Ω)		
Low Temperature Operation	Place the specimen in a test chamber maintained at $-65 \ (+0/-5)^{\circ}$ C. After one hour stabilization at this temperature, full rated working voltage shall be applied for 45 $(+5/-0)$ minutes. Have I 5 $(+5/-0)$ minutes after remove the voltage, the specimen shall be removed from the chamber and stabilized at room temperature for 24 hrs. Measure the resistance to determine $\Delta R/R(\%)$.			\pm (1.0%+0.05Ω) No visible damage		
Short Time Overload	Apply 2.5 times of rated voltage but not exceeding the maximum overload voltage for 5 seconds. Have the specimen stabilized at room temperature for 30 minutes minimum. Measure the resistance to determine Δ R/R(%).			$\pm (2.0\% + 0.05\Omega)$ No visible damage
