

General Description

The DS2045 is a 1Mb reflowable nonvolatile (NV) SRAM, which consists of a static RAM (SRAM), an NV controller, and an internal rechargeable manganese lithium (ML) battery. These components are encased in a surface-mount module with a 256-ball BGA footprint. Whenever V_{CC} is applied to the module, it recharges the ML battery, powers the SRAM from the external power source, and allows the contents of the SRAM to be modified. When VCC is powered down or out of tolerance, the controller write-protects the SRAM's contents and powers the SRAM from the battery. Two versions of the DS2045 are available, which provide either a 5% or 10% power-monitoring trip point. The DS2045 also contains a power-supply monitor output, RST, which can be used as a CPU supervisor for a microprocessor.

Applications

RAID Systems and Servers POS Terminals

Industrial Controllers **Data-Acquisition Systems**

Fire Alarms Gaming

PI C Router/Switches

Features

- Single-Piece, Reflowable, 27mm² PBGA Package **Footprint**
- ♦ Internal ML Battery and Charger
- ♦ Unconditionally Write-Protects SRAM when V_{CC} is Out-of-Tolerance
- ♦ Automatically Switches to Battery Supply when **Vcc Power Failures Occur**
- **♦ Internal Power-Supply Monitor Detects Power Fail** at 5% or 10% Below Nominal V_{CC} (5V)
- ♦ Reset Output can be used as a CPU Supervisor for a Microprocessor
- **♦** Industrial Temperature Range (-40°C to +85°C)
- ♦ UL Recognized

Pin Configuration appears at end of data sheet.

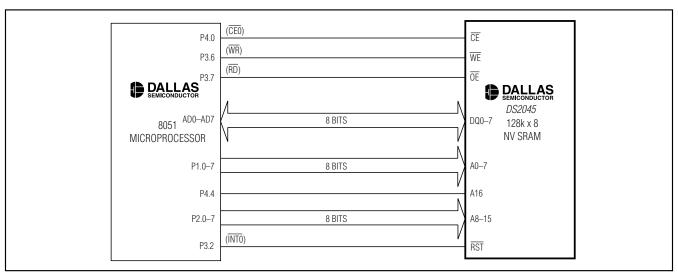

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	SPEED (ns)	SUPPLY TOLERANCE
DS2045AB-70	-40°C to +85°C	256 Ball 27mm ² BGA Module	70	5
DS2045AB-70#	-40°C to +85°C	256 Ball 27mm ² BGA Module	70	5

[#]Denotes a RoHS-compliant device that may include lead that is exempt under the RoHS requirements.

ABSOLUTE MAXIMUM RATINGS

Voltage on Any Pin Relative to Ground0.3V to +6.0V	Storage Temperature Range40°C to +85°C
Operating Temperature Range40°C to +85°C	Soldering TemperatureSee IPC/JEDEC J-STD-020

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

Power-Down/Power-Up Condition

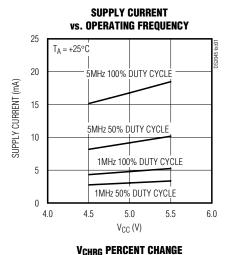

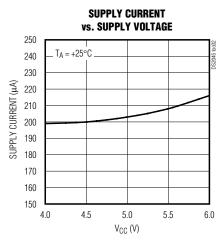

- **Note 1:** RST is an open-drain output and cannot source current. An external pullup resistor should be connected to this pin to realize a logic-high level.
- **Note 2:** These parameters are sampled with a 5pF load and are not 100% tested.
- Note 3: twp is specified as the logical AND of \overline{CE} and \overline{WE} . twp is measured from the latter of \overline{CE} or \overline{WE} going low to the earlier of \overline{CE} or \overline{WE} going high.
- **Note 4:** tWR1 and tDH1 are measured from \overline{WE} going high.
- **Note 5:** t_{WR2} and t_{DH2} are measured from \overline{CE} going high.
- **Note 6:** tps is measured from the earlier of \overline{CE} or \overline{WE} going high.
- Note 7: In a power-down condition, the voltage on any pin can not exceed the voltage on VCC.
- Note 8: The expected top is defined as accumulative time in the absence of VCC starting from the time power is first applied by the user. Minimum expected data-retention time is based on a maximum of two 230°C convection solder reflow exposures, followed by a fully charged cell. Full charge occurs with the initial application of VCC for a minimum of 96 hours. This parameter is assured by component selection, process control, and design. It is not measured directly in production testing.
- **Note 9:** \overline{WE} is high for a read cycle.
- **Note 10:** $\overline{OE} = V_{IH}$ or V_{IL} . If $\overline{OE} = V_{IH}$ during write cycle, the output buffers remain in a high-impedance state.
- Note 11: If the $\overline{\text{CE}}$ low transition occurs simultaneously with or latter than the $\overline{\text{WE}}$ low transition, the output buffers remain in a high-impedance state during this period.
- Note 12: If the $\overline{\text{CE}}$ high transition occurs prior to or simultaneously with the $\overline{\text{WE}}$ high transition, the output buffers remain in a high-impedance state during this period.
- Note 13: If WE is low or the WE low transition occurs prior to or simultaneously with the CE low transition, the output buffers remain in a high-impedance state during this period.
- Note 14: DS2045 BGA modules are recognized by Underwriters Laboratory (UL) under file E99151.

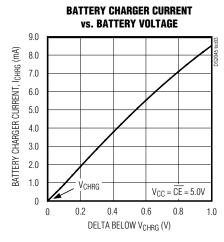

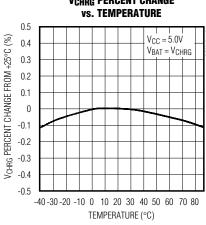

Typical Operating Characteristics

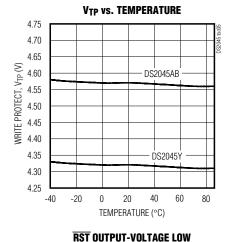

($V_{CC} = +5.0V$, $T_A = +25$ °C, unless otherwise noted.)

Functional Diagram

Detailed Description

The DS2045 is a 1Mb (128k x 8 bits) fully static, NV memory similar in function and organization to the DS1245 NV SRAM, but containing a rechargeable ML battery. The DS2045 NV SRAM constantly monitors VCC for an out-of-tolerance condition. When such a condition occurs, the lithium energy source is automatically switched on and write protection is unconditionally enabled to prevent data corruption. There is no limit to the number of write cycles that can be executed and no additional support circuitry is required for microprocessor interfacing. This device can be used in place of SRAM, EEPROM, or flash components.

The DS2045 assembly consists of a low-power SRAM, an ML battery, and an NV controller with a battery charger, integrated on a standard 256-ball, 27mm² BGA substrate. Unlike other surface-mount NV memory modules that require the battery to be removable for soldering, the internal ML battery can tolerate exposure to convection reflow soldering temperatures allowing this single-piece component to be handled with standard BGA assembly techniques.

Two versions of the DS2045 are available that provide either a 5% (DS2045AB) or 10% (DS2045Y) power-monitoring trip point. The DS2045 also contains a power-supply monitor output, RST, which can be used as a CPU supervisor for a microprocessor.

Memory Operation Truth Table

WE	CE	ŌĒ	MODE	Icc	OUTPUTS
1	0	0	Read	Active	Active
1	0	1	Read	Active	High Impedance
0	0	Х	Write	Active	High Impedance
X	1	X	Standby	Standby	High Impedance

X = Don't care.

Read Mode

The DS2045 executes a read cycle whenever \overline{WE} (write enable) is inactive (high) and \overline{CE} (chip enable) is active (low). The unique address specified by the 17 address inputs (A0 to A16) defines which of the 131,072 bytes of data is to be accessed. Valid data will be available to the eight data output drivers within tACC (access time) after the last address input signal is stable, providing that \overline{CE} and \overline{OE} (output enable) access times are also satisfied. If \overline{CE} and \overline{OE} access times are not satisfied, then data access must be measured from the later occurring signal (\overline{CE} or \overline{OE}) and the limiting parameter is either tCO for \overline{CE} or tOE for \overline{OE} rather than address access.

Write Mode

The DS2045 executes a write cycle whenever the $\overline{\text{CE}}$ and $\overline{\text{WE}}$ signals are active (low) after address inputs are stable. The later-occurring falling edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$ will determine the start of the write cycle. The write cycle is terminated by the earlier rising edge of $\overline{\text{CE}}$ or $\overline{\text{WE}}$. All address inputs must be kept valid throughout the write cycle. $\overline{\text{WE}}$ must return to the high state for a minimum recovery time (twr) before another cycle can be initiated. The $\overline{\text{OE}}$ control signal should be kept inactive (high) during write cycles to avoid bus contention. However, if the output drivers have been enabled ($\overline{\text{CE}}$ and $\overline{\text{OE}}$ active) then $\overline{\text{WE}}$ will disable the outputs in topw from its falling edge.

Data-Retention Mode

The DS2045AB provides full functional capability for VCC greater than 4.75V and write-protects at 4.5V. The DS2045Y provides full functional capability for VCC greater than 4.5V and write-protects at 4.25V. Data is maintained in the absence of VCC without additional support circuitry. The NV static RAM constantly monitors VCC. Should the supply voltage decay, the NV SRAM automatically write-protects itself. All inputs become "don't care", and all data outputs become high impedance. As VCC falls below approximately 2.7V

(Vsw), the power-switching circuit connects the lithium energy source to the RAM to retain data. During power-up, when Vcc rises above Vsw, the power-switching circuit connects external Vcc to the RAM and disconnects the lithium energy source. Normal RAM operation can resume after Vcc exceeds VTP for a minimum duration of tREC.

Battery Charging

When V_{CC} is greater than V_{TP}, an internal regulator charges the battery. The UL-approved charger circuit includes short-circuit protection and a temperature-stabilized voltage reference for on-demand charging of the internal battery. Typical data-retention expectations of 3 years *per charge cycle* are achievable.

A maximum of 96 hours of charging time is required to fully charge a depleted battery.

System Power Monitoring

When the external VCC supply falls below the selected out-of-tolerance trip point, the output \overline{RST} is forced active (low). Once active, the \overline{RST} is held active until the VCC supply has fallen below that of the internal battery. On power-up, the \overline{RST} output is held active until the external supply is greater than the selected trip point and one reset timeout period (tRPU) has elapsed. This is sufficiently longer than tREC to ensure that the SRAM is ready for access by the microprocessor.

Freshness Seal and Shipping

The DS2045 is shipped from Dallas Semiconductor with the lithium battery electrically disconnected, guaranteeing that no battery capacity has been consumed during transit or storage. As shipped, the lithium battery is ~60% charged, and no preassembly charging operations should be attempted.

When V_{CC} is first applied at a level greater than V_{TP}, the lithium battery is enabled for backup operation. A 96 hour initial battery charge time is recommended for new system installations.

Recommended Reflow Temperature Profile

PROFILE FEATURE	Sn-Pb EUTECTIC ASSEMBLY
Average ramp-up rate (T _L to T _P)	3°C/second max
Preheat - Temperature min (T _{Smin}) - Temperature max (T _{Smax}) - Time (min to max) (ts)	100°C 150°C 60 to 120 seconds
T _{Smax} to T _L - Ramp-up rate	
Time maintained above: - Temperature (T _L) - Time (t _L)	183°C 60 to 150 seconds
Peak temperature (T _P)	225 +0/-5°C
Time within 5°C of actual peak temperature (T _P)	10 to 30 seconds
Ramp-down rate	6°C/second max
Time 25°C to peak temperature	6 minutes max

Note: All temperatures refer to top side of the package, measured on the package body surface.

Recommended Cleaning Procedures

The DS2045 may be cleaned using aqueous-based cleaning solutions. No special precautions are needed when cleaning boards containing a DS2045 module.

Removal of the topside label violates the environmental integrity of the package and voids the warranty of the product.

Applications Information

Power-Supply Decoupling

To achieve the best results when using the DS2045, decouple the power supply with a 0.1µF capacitor. Use a high-quality, ceramic surface-mount capacitor if possible. Surface-mount components minimize lead inductance, which improves performance, while ceramic capacitors have adequately high frequency response for decoupling applications.

Using the Open-Drain RST Output

The RST output is open drain, and therefore requires a pullup resistor to realize a high logic output level. Pullup resistor values between $1k\Omega$ and $10k\Omega$ are typical.

Battery Charging/Lifetime

The DS2045 charges an ML battery to maximum capacity in approximately 96 hours of operation when V_{CC} is greater than V_{TP}. Once the battery is charged, its lifetime depends primarily on the V_{CC} duty cycle. The DS2045 can maintain data from a single, initial charge for up to 3 years. Once recharged, this deep-discharge cycle can be repeated up to 20 times, producing a worst-case service life of 60 years. More typical duty cycles are of shorter duration, enabling the DS2045 to be charged hundreds of times, therefore extending the service life well beyond 60 years.
