## Use production site information in a variety of applications, such as maintenance and quality control.

OMRON's DRT2-series Smart Slaves do not just input and output ON/OFF signals. They collect a variety of value-added information to help increase the rate of operation without changing the wiring for existing DeviceNet networks. In particular, they allow the separation of control systems and maintenance systems so that maintenance systems can be created independently of control systems.

## Collect a variety of data from maintenance systems without influencing control systems and productivity.

All data can be converted to electronic format and, by combining with an OMRON PLC (CS/CJ Series), checked directly from Ethernet or the Internet to allow remote maintenance.

Unit conduction time monitor error
$\qquad$ Communications power voltage monitor error

Note: The contact operation counter function and the unit conduction time monitor function cannot be used simultaneously.

## Using OMRON Temperature Input Terminals for Maintenance

Failure Prediction and Maintenance

If prolonging the time it takes to reach a certain temperature may degrade equipment:

## Short Startup

If it takes too long to modify the ladder program on the Master when a Temperature Sensor is replaced:

The operating time of a preset temperature range is counted in 1 -s units.

The peaks or valleys of temperature inputs that change in a regular pattern are counted to predict when devices operating with severe temperature swings are due for maintenance.

## Slaves internally

 convert display values to temperature input values so the Controller program no longer has to be modified to perform this task.

Wide variety of control and maintenance functions using DeviceNet.

O: Yes, ---: No
Note: The contact operation count monitor and the total RUN (ON) time monitor cannot be used at the same time for one contact.
External load detection is supported only by the DRT2-MD32LLH-1 and DRT2-OD32SLH-1.
