

Power Supply, Primary Switch Mode, Narrow Design MINI-PS-100-240AC/10-15DC/2

MINI POWER provides:

- **Extra narrow** widths of 22.5, 45, and 67.5 mm (0.886, 1.772, and 2.657 in.)
- **Global use** due to a wide range input
- **A high level of operational safety** in complex global networks
- **Reliable startup** of heavy loads due to POWER BOOST

The reliability of a power supply determines the availability of individual components in a system and whether complex systems can function safely.

The globalization of markets increases the demands placed on the power supply. A wide range input and a high level of availability are required. These requirements are met by MINI POWER.

1. Short Description

MINI POWER is the extra narrow power supply, which is available in widths of 22.5, 45, and 67.5 mm (0.886, 1.772, and 2.657 in.).

In addition to a 24 V version with output currents of 1 A, 2 A, and 4 A, special voltages are also available with 5 V/3 A, +/-15 V/1 A, and 10 - 15 V/2 A.

Reliable startup of heavy loads is ensured by a power reserve of up to 100% - the POWER BOOST.

The high level of operational safety is also ensured in complex global networks. MINI POWER also operates in applications where static voltage dips, transient power supply failures or phase failure are common.

Large capacitors ensure mains buffering of more than 20 ms at full load.

2. Area of Application

MINI POWER can be used globally due to the consistent provision of a wide range input.

In this way, your entire system can be tested at any production location in the world and can be delivered to any location in the world without faulty switching of the input voltage. This reduces storage costs and logistical effort.

An international approval package including UL 60950 for IT equipment and UL 508 for industrial control equipment enables the device to be used globally.

- ④ **Potentiometer 10 - 15 V DC**
- ⑤ **Universal latching foot for EN DIN rails**

5. Safety and Warning Instructions

To ensure that the device can be operated safely and all functions can be used, please read these instructions carefully.

Caution: Never carry out work when the power is turned on, this is highly dangerous.

Installation and startup must only be carried out by qualified personnel. The relevant country-specific regulations (e.g., VDE, DIN) must also be observed.

Before startup it is particularly important to ensure that:

- The mains have been connected correctly and protection is provided against electric shock.
- The device can be switched off outside the power supply according to EN 60950 regulations (e.g., by the line protection on the primary side).
- All supply lines have sufficient fuse protection and are the correct size.
- All output cables are the correct size for the maximum device output current or have separate fuse protection.
- Sufficient convection is ensured.

MINI POWER is a built-in device. After installation the terminal area must be covered to provide sufficient protection against unauthorized access to live parts. This is ensured by installing the device in the control cabinet or distributor box.

The device contains dangerous live components and high levels of stored energy.

6. Installation

6.1. Mounting

The power supply can be snapped onto all DIN rails according to EN 50022-35. The device must be mounted horizontally (input terminal blocks facing downwards).

Installation Dimensions

To ensure sufficient convection, we recommend a minimum spacing of 5 cm (1.969 in.) to other modules above and below the device.

Figure 05

Figure 06

Mounting:

Place the module with the DIN rail guideway on the **top edge** of the DIN rail and then snap it **downwards**.

Removal:

Release the snap-on catch using a screwdriver and then detach the module from the **bottom edge** of the DIN rail.

Figure 07

Figure 08

Connection Cable:

The device is equipped with COMBICON connectors. This reliable user-friendly connection method enables quick device connection and safe isolation of the electrical connection, if required. **Only operate connectors when the power is switched off.**

The following cable cross sections can be connected:

	Solid [mm ²]	Flexible [mm ²]	AWG	Torque [Nm]	Torque [lb in.]
① Input:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6	4.4 - 5.3
② Output:	0.2 - 2.5	0.2 - 2.5	25 - 14	0.5 - 0.6	4.4 - 5.3

For reliable and safe-to-touch connection: Strip 7 mm (0.28 in.) from the connector ends.

Figure 09

A suitable fuse must be fitted for DC applications.

If the internal fuse is blown, this is most probably due to a device fault. In this case, the device should be checked in the factory.

6.3. Input (①, Figure 9)

The 100 - 240 V AC connection is made using screw connections L and N. The device can be connected to single-phase AC networks or to two external conductors for three-phase networks (TN, TT or IT network according to VDE 0100 T300/IEC364-3) with nominal voltages of 100 - 240 V AC.

Protecting the Primary Side

The device must be installed according to the specifications of EN 60 950. It must be possible to switch off the device using a suitable disconnecting device outside the power supply.

Note that an all-pole disconnecting device must be provided for two-phase operation using two external conductors for a three-phase network.

For example, primary side line protection could be used.

Additional device protection is not required, as an internal fuse is present.

Recommended Fuse:

Circuit breaker 6 A or 10 A, Characteristic B (or equivalent).

6.4. Output (②, Figure 9)

The 10 - 15 V DC connection is made using the "+" and "-" screw connections on the screw connection ②.

Protecting the Secondary Side:

The device is electronic short-circuit-proof and idling-proof. In the event of an error, the output voltage is limited to a maximum of 20 V DC.

It should be ensured that all output cables are the correct size for the maximum output current or have separate fuse protection.

The secondary side cables should have large cross sections to keep voltage drops on the cables to a minimum.

DC OK LED

The green DC OK LED enables local function evaluation in the control cabinet.

LED ON	Normal operation of the power supply
LED OFF	<p>a) The output voltage is $\leq 0.9 \times U_N$. There is a secondary load short circuit or overload outside the POWER BOOST area.</p> <p>b) No mains voltage is present or there is a device fault.</p>

7. Function

7.1. Output Characteristic Curve (Figure 10).

The device can supply a nominal output current of 2 A up to an ambient temperature of 60°C (140°F). With an ambient temperature of up to 40°C (104°F) the device continuously supplies an output current of 2.3 A. At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 2.3 A for a few minutes.

With high loads, the working point demonstrates the U/I characteristic curve shown in Figure 10.

On an overload or short circuit, the entire output current I_{BOOST} is provided permanently at a reduced output voltage.

Once the overload or short circuit has been removed, the entire set secondary voltage is available again.

The U/I characteristic curve ensures that both heavy capacitive loads and devices with DC/DC converters can be supplied by MINI POWER in the input circuit without any problems.

Connected fuses are reliably tripped. The selectivity in your system configuration is ensured at all times.

Figure 10

7.2. Temperature Response

The device can supply a nominal output current of 4 A up to an ambient temperature of 60°C (140°F). With an ambient temperature of up to 40°C (104°F) the device continuously supplies an output current of 5 A. At temperatures up to 60°C (140°F), the POWER BOOST provides a short-term output current of 6 A for a few minutes.

The output power must be decreased by 5% per Kelvin temperature increase for ambient temperatures above +60°C (+140°F). At ambient temperatures above +70°C (+158°F) or in the event of a thermal overload, the device reduces the output power to protect itself and returns to normal operation once it has cooled down.

Figure 11

7.3. Parallel Operation

Devices of the same type can be connected in parallel to increase both redundancy and power. The default setting does not have to be adjusted.

To ensure symmetrical current distribution we recommend that all cable connections from the power supply to the DIN rail are the same length and have the same cross section.

Depending on the system, for parallel connection of more than two power supplies a protective circuit should be installed at each individual device output (e.g., decoupling diode or DC fuse). This means that in the event of a secondary device fault high return currents are avoided.

Figure 12

7.4. Redundancy Operation

Redundant connections are designed for supplying systems, which place particularly high requirements on operational safety. If a fault occurs in the primary circuit of device 1, device 2 automatically takes over the complete power supply without interruption and vice versa.

For this purpose, the power supplies to be connected in parallel must be large enough that the total current requirements of all loads can be fully met by one power supply. External decoupling diodes are required for 100% redundancy.

Figure 12

7.5. Power Increase

The output current can be increased to $n \times I_N$ where n is the number of devices connected in parallel.

The parallel connection for power increase can be used to extend existing systems. A parallel connection is recommended if the power supply does not cover the current consumption of the most powerful load. Otherwise, the loads should be divided over independent individual devices.

A maximum of five devices can be connected in parallel.
