

## The Future of Analog IC Technology ${ }^{\mathrm{Tm}}$

## DESCRIPTION

The MP28368 is a monolithic step-down switch mode converter with a built-in internal power MOSFET. It achieves 1.8A continuous output current over a wide input supply range with excellent load and line regulation. Current mode operation provides fast transient response and eases loop stabilization. Fault condition protection includes cycle-by-cycle current limiting and thermal shutdown.

The MP28368 requires a minimum number of readily available standard external components. The MP28368 is available in a $2 \mathrm{~mm} \times 2 \mathrm{~mm}$ QFN8 package.

## FEATURES

- 2.5A Peak Output Current
- 1.8A Continuous Output Current
- $0.3 \Omega$ Internal Power MOSFET Switch
- Stable with Low ESR Output Ceramic Capacitors
- $0.1 \mu \mathrm{~A}$ Shutdown Mode
- Fixed 1.4 MHz Frequency
- Thermal Shutdown
- Cycle-by-Cycle Over Current Protection
- Wide 4.5 V to 24 V Operating Input Range
- Output Adjustable from 0.81 V to 15 V
- Available in $2 \times 2$ QFN8 Packages

## APPLICATIONS

- Broadband Communications Equipment
- Digital Entertainment Systems
- Distributed Power Systems
- Battery Charger
- Pre-Regulator for Linear Regulators
"MPS" and "The Future of Analog IC Technology" are Trademarks of Monolithic Power Systems, Inc.

## TYPICAL APPLICATION

## PACKAGE REFERENCE

* For Tape \& Reel, add suffix -Z (eg. MP28368DG-Z)

For RoHS compliant packaging, add suffix -LF (eg. MP28368DG-LF-Z)
ABSOLUTE MAXIMUM RATINGS ..... (1)
Supply Voltage $\mathrm{V}_{\mathrm{IN}}$ ..... 26V
$V_{\text {sw }}$ ..... -0.3 V to $\mathrm{V}_{\mathrm{IN}}+0.3 \mathrm{~V}$
$V_{B S}$ ..... $\mathrm{V}_{\mathrm{sw}}+6 \mathrm{~V}$
All Other Pins ..... -0.3 V to +6 V
Junction Temperature ..... $150^{\circ} \mathrm{C}$
Lead Temperature ..... $260^{\circ} \mathrm{C}$
Storage Temperature

$\qquad$
$-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Recommended Operating Conditions ..... (2)
Supply Voltage $\mathrm{V}_{\mathrm{IN}}$ ..... 4.5 V to 24 V
Output Voltage $\mathrm{V}_{\text {OUT }}$ ..... 0.81 V to 15 V
Operating Temperature

$\qquad$
$40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$
Thermal Resistance ..... ${ }^{(3)}$
$\boldsymbol{\theta}_{J A} \quad \boldsymbol{\theta}_{J C}$

$\qquad$ ..... ${ }^{\circ} \mathrm{C} / \mathrm{W}$

## Notes:

1) Exceeding these ratings may damage the device.
2) The device is not guaranteed to function outside of its operating conditions
3) Measured on approximately 1 " square of 1 oz copper.

## ELECTRICAL CHARACTERISTICS

$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.

| Parameters | Symbol | Condition | Min | Typ | Max | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Feedback Voltage | $\mathrm{V}_{\text {FB }}$ | $4.5 \mathrm{~V} \leq \mathrm{V}_{\text {IN }} \leq 24 \mathrm{~V}$ | 0.790 | 0.810 | 0.830 | V |
| Feedback Current | $\mathrm{I}_{\text {FB }}$ | $\mathrm{V}_{\mathrm{FB}}=0.8 \mathrm{~V}$ |  | 10 |  | nA |
| Switch On-Resistance ${ }^{(4)}$ | $\mathrm{R}_{\mathrm{DS} \text { (ON) }}$ |  |  | 0.3 |  | $\Omega$ |
| Switch Leakage |  | $\mathrm{V}_{\text {EN }}=0 \mathrm{~V}, \mathrm{~V}_{\text {SW }}=0 \mathrm{~V}$ |  | 0 | 10 | $\mu \mathrm{A}$ |
| Current Limit ${ }^{(4)}$ |  | Duty Cycle $=40 \%$ | 2.0 | 2.5 |  | A |
| Oscillator Frequency | $\mathrm{f}_{\text {sw }}$ | $\mathrm{V}_{\mathrm{FB}}=0.6 \mathrm{~V}$ |  | 1.4 |  | MHz |
| Fold-back Frequency |  | $\mathrm{V}_{\text {FB }}=0 \mathrm{~V}$ |  | 460 |  | KHz |
| Maximum Duty Cycle |  | $\mathrm{V}_{\mathrm{FB}}=0.6 \mathrm{~V}$ |  | 87 |  | \% |
| Minimum On-Time ${ }^{(4)}$ | $\mathrm{t}_{\mathrm{ON}}$ |  |  | 100 |  | ns |
| Under-Voltage Lockout Threshold Rising |  |  | 2.5 | 2.8 | 3.1 | V |
| Under-Voltage Lockout Threshold Hysteresis |  |  |  | 150 |  | mV |
| EN Input Low Voltage |  |  |  |  | 0.4 | V |
| EN Input High Voltage |  |  | 1.2 |  |  | V |
| EN Input Current |  | $\mathrm{V}_{\text {EN }}=2 \mathrm{~V}$ |  | 2.1 |  | $\mu \mathrm{A}$ |
|  |  | $\mathrm{V}_{\text {EN }}=0 \mathrm{~V}$ |  | 0.01 |  |  |
| Supply Current (Shutdown) |  | $\mathrm{V}_{\text {EN }}=0 \mathrm{~V}$ |  | 0.1 | 1.0 | $\mu \mathrm{A}$ |
| Supply Current (Quiescent) |  | $\mathrm{V}_{\mathrm{EN}}=2 \mathrm{~V}, \mathrm{~V}_{\mathrm{FB}}=1 \mathrm{~V}$ |  | 0.8 | 1.0 | mA |
| Thermal Shutdown ${ }^{(4)}$ |  |  |  | 150 |  | ${ }^{\circ} \mathrm{C}$ |

## Note:

4) Guaranteed by design.

## PIN FUNCTIONS

| Pin \# | Name | Description |
| :---: | :---: | :--- |
| 1,8 | NC | No Connect. |
| 2 | SW | Switch Output. |
| 3 | IN | Supply Voltage. The MP28368 operates from a +4.5V to +24V unregulated input. C1 is needed <br> to prevent large voltage spikes from appearing at the input. |
| 4 | EN | On/Off Control Input. Pull above 1.2V to turn the device on. |
| 5 | FB | Feedback. An external resistor divider from the output to GND, tapped to the FB pin sets the <br> output voltage. To prevent current limit run away during a short circuit fault condition the <br> frequency foldback comparator lowers the oscillator frequency when the FB voltage is below <br> 250mV. |
| 6 | GND | Ground. This pin is the voltage reference for the regulated output voltage. For this reason care <br> must be taken in its layout. This node should be placed outside of the D1 to C1 ground path to <br> prevent switching current spikes from inducing voltage noise into the part. |
| 7 | BST | Bootstrap. This capacitor is needed to drive the power switch's gate above the supply voltage. It <br> is connected between SW and BST pins to form a floating supply across the power switch <br> driver. |

## TYPICAL PERFORMANCE CHARACTERISTICS

$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.

## TYPICAL PERFORMANCE CHARACTERISTICS (continued)

$V_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.

Steady State Test
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$, $\mathrm{I}_{\text {OUT }}=0.5 \mathrm{~A}$
Load Transient Test

Start-up through Enable
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$, No Load

Shut-down through Enable
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$,
$I_{\text {OUT }}=2 A$ Resistive Load

Start-up through Enable
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$,
$\mathrm{I}_{\text {OUT }}=2$ A Resistive Load

Shut-down through Enable
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$, No Load

Short Circuit Recovery
$\mathrm{V}_{\text {IN }}=12 \mathrm{~V}, \mathrm{~V}_{\text {OUT }}=3.3 \mathrm{~V}$

## OPERATION

The MP28368 is a current mode buck regulator. That is, the EA output voltage is proportional to the peak inductor current.

At the beginning of a cycle, M1 is off. The EA output voltage is higher than the current sense amplifier output, and the current comparator's output is low. The rising edge of the 1.4 MHz CLK signal sets the RS Flip-Flop. Its output turns on M1 thus connecting the SW pin and inductor to the input supply.

The increasing inductor current is sensed and amplified by the Current Sense Amplifier. Ramp compensation is summed to Current Sense Amplifier output and compared to the Error Amplifier output by the PWM Comparator. When the sum of the Current Sense Amplifier output and the Slope Compensation signal exceeds the EA output voltage, the RS FlipFlop is reset and the M1 is turned off. The external Schottky rectifier diode (D1) conducts the inductor current.

If the sum of the Current Sense Amplifier output and the Slope Compensation signal does not exceed the EA output for a whole cycle, then the falling edge of the CLK resets the Flip-Flop.

The output of the Error Amplifier integrates the voltage difference between the feedback and the 0.81 V bandgap reference. The polarity is such that a FB pin voltage lower than 0.8 V increases the EA output voltage. Since the EA output voltage is proportional to the peak inductor current, an increase in its voltage also increases current delivered to the output.

Figure 1—Functional Block Diagram

## APPLICATION INFORMATION

## Setting Output Voltage

The external resistor divider is used to set the output voltage (see the schematic on front page). The feedback resistor R1 also sets the feedback loop bandwidth with the internal compensation capacitor (see Figure 1). R2 can be determined by:

$$
\mathrm{R} 2=\frac{\mathrm{R} 1}{\frac{\mathrm{~V}_{\text {OUT }}}{0.81 \mathrm{~V}}-1}
$$

Table 1—Resistor Selection for Common Output Voltages

| $\mathbf{V}_{\text {OUT }}(\mathbf{V})$ | $\mathbf{R 1}(\mathbf{k} \mathbf{\Omega})$ | $\mathbf{R 2}(\mathbf{k} \mathbf{\Omega})$ |
| :---: | :---: | :---: |
| 1.8 | $80.6(1 \%)$ | $64.9(1 \%)$ |
| 2.5 | $49.9(1 \%)$ | $23.7(1 \%)$ |
| 3.3 | $49.9(1 \%)$ | $16.2(1 \%)$ |
| 5 | $49.9(1 \%)$ | $9.53(1 \%)$ |

## Selecting the Inductor

A $1 \mu \mathrm{H}$ to $10 \mu \mathrm{H}$ inductor with a DC current rating of at least $25 \%$ percent higher than the maximum load current is recommended for most applications. For highest efficiency, the inductor's DC resistance should be less than $200 \mathrm{~m} \Omega$. For most designs, the required inductance value can be derived from the following equation.

$$
\mathrm{L}=\frac{\mathrm{V}_{\text {OUT }} \times\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {OUT }}\right)}{\mathrm{V}_{\text {IN }} \times \Delta \mathrm{I}_{\mathrm{L}} \times \mathrm{f}_{\mathrm{OSC}}}
$$

Where $\Delta I_{L}$ is the inductor ripple current.
Choose an inductor with a rating current of approximately $30 \%$ higher than the maximum load current if the maximum load current is $\geq 1.8 \mathrm{~A}$. The maximum inductor peak current is calculated from:

$$
\mathrm{I}_{\mathrm{L}(\operatorname{MAX})}=\mathrm{I}_{\mathrm{LOAD}}+\frac{\Delta \mathrm{I}_{\mathrm{L}}}{2}
$$

Under light load conditions below 100 mA , a larger inductance is recommended for improved efficiency. See Table 2 for suggested inductors.

## Selecting the Input Capacitor

The input capacitor reduces the surge current drawn from the input and the switching noise from the device. The input capacitor impedance at the switching frequency should be less than the input source impedance to prevent high frequency switching current from passing through the input. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. For most applications, a $10 \mu \mathrm{~F}$ capacitor is sufficient.

## Selecting the Output Capacitor

The output capacitor keeps output voltage ripple small and ensures loop stability. The output capacitor impedance should be low at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended for their low ESR characteristics. For most applications, a $22 \mu \mathrm{~F}$ ceramic capacitor will be sufficient.

## PC Board Layout

The high current paths (GND, IN and SW) should be placed very close to the device with short, direct and wide traces. The input capacitor needs to be as close as possible to the IN and GND pins. The external feedback resistors should be placed next to the FB pin. Keep the switch node traces short and away from the feedback network.

## External Bootstrap Diode

It is recommended that an external bootstrap diode be added when the input voltage is no greater than 5 V or the 5 V rail is available in the system. This helps improve the efficiency of the regulator. The bootstrap diode can be a low cost one such as IN4148 or BAT54.

Figure 2-External Bootstrap Diode
This diode is also recommended for high duty cycle operation (when $\frac{\mathrm{V}_{\text {OUT }}}{\mathrm{V}_{\text {IN }}}>65 \%$ ) applications.

Table 2—Suggested Surface Mount Inductors

| Manufacturer | Part Number | Inductance( $\boldsymbol{\mu H})$ | Max DCR( $\boldsymbol{\Omega})$ | Current Rating <br> $(\mathbf{A})$ | Dimensions <br> $\mathbf{L} \mathbf{x ~ W ~ \mathbf { ~ X ~ H ~ ( m m ~ }} \mathbf{~})$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Wurth Electronics | 7447785004 | 4.7 | 0.060 | 2.5 | $5.9 \times 6.2 \times 3.3$ |
| Toko | A916CY-4R7M | 4.7 | 0.026 | 2.5 | $6.2 \times 6.3 \times 3.5$ |
| Coiltronics | DR73-4R7 | 4.7 | 0.03 | 3 | $6.0 \times 7.6 \times 3.5$ |
