I²C TEMPERATURE SENSORS

Features

- High Accuracy Temperature Sensors
  - Si7053: ±0.3 °C (max)
  - Si7054: ±0.4 °C (max)
  - Si7055: ±0.5 °C (max)
  - Si7050: ±1.0 °C (max)
- Wide operating voltage (1.9 to 3.6 V)
- –40 to +125 °C operating range
- Accuracy maintained over the entire operating temperature and voltage range
- Low Power Consumption
  - 195 nA average current @ 1 Hz sample rate
- 14-bit resolution
- Factory calibrated
- I²C interface
- 3x3 mm DFN package

Ordering Information:
See page 19.

Applications

- HVAC/R
- Thermostats
- White goods
- Computer equipment
- Portable consumer devices
- Asset tracking
- Cold chain storage
- Battery protection
- Industrial controls
- Medical equipment

Patent Protected. Patents pending

Description

The Si705x Digital Temperature Sensors offer industry-leading low power consumption and high accuracy across the entire operating voltage and temperature range. These monolithic CMOS ICs feature a band-gap temperature sensor element, an analog-to-digital converter with up to 14-bit resolution, signal processing, calibration data, and an I²C interface. The patented use of novel signal processing and analog design enables the sensors to maintain their accuracy over a wide temperature and voltage range, while consuming very little current.

The temperature sensors are factory-calibrated and the calibration data is stored in the on-chip non-volatile memory. This ensures that the sensors are fully interchangeable, with no recalibration or software changes required.

The Si705x devices are available in a 3x3 mm DFN package, and the industry-standard I²C interface can operate at up to 400 kHz. Requiring just 195 nA of average current when sampled once per second, the Si705x can operate for several years with just a single coin cell battery.

The Si705x devices offer an accurate, low-power, factory-calibrated digital solution ideal for measuring temperature in applications ranging from HVAC/R and asset tracking to industrial and consumer platforms.

Si7050/3/4/5-A20

SILICON LABS

TABLE OF CONTENTS

SILICON LABS

1. Electrical Specifications

Unless otherwise specified, all min/max specifications apply over the recommended operating conditions.

Table 1. Recommended Operating Conditions

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Power Supply	V_{DD}		1.9	—	3.6	V
Operating Temperature	T_A		–40	—	+125	°C

Table 2. General Specifications

$1.9 \leq V_{DD} \leq 3.6$ V; T_A = –40 to 125 °C default conversion time unless otherwise noted.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Input Voltage High	V_{IH}	SCL, SDA pins	0.7 x V_{DD}	—	—	V
Input Voltage Low	V_{IL}	SCL, SDA pins	—	—	0.3 x V_{DD}	V
Input Voltage Range	V_{IN}	SCL, SDA pins with respect to GND	0.0	—	V_{DD}	V
Input Leakage	I_{IL}	SCL, SDA pins	—	—	1	µA
Output Voltage Low	V_{OL}	SDA pin; I_{OL} = 2.5 mA; V_{DD} = 3.3 V	—	—	0.6	V
		SDA pin; I_{OL} = 1.2 mA; V_{DD} = 1.9 V	—	—	0.4	V
Current Consumption	I_{DD}	Temperature conversion in progress	—	90	120	µA
		Standby, –40 to +85 °C[1]	—	0.06	0.62	µA
		Standby, –40 to +125 °C[1]	—	0.06	3.8	µA
		Peak IDD during powerup[2]	—	3.5	4.0	mA
		Peak IDD during I²C operations[3]	—	3.5	4.0	mA
Conversion Time	t_{CONV}	14-bit temperature	—	7	10.8	ms
		13-bit temperature	—	4	6.2	ms
		12-bit temperature	—	2.4	3.8	ms
		11-bit temperature	—	1.5	2.4	ms
Powerup Time	t_{PU}	From V_{DD} ≥ 1.9 V to ready for a conversion, 25 °C	—	18	25	ms
		From V_{DD} ≥ 1.9 V to ready for a conversion, full temperature range	—	—	80	
		After issuing a software reset command	—	5	15	

Notes:
1. No conversion or I²C transaction in progress. Typical values measured at 25 °C.
2. Occurs once during powerup. Duration is <5 msec.
3. Occurs during I²C commands for Reset, Read/Write User Registers, Read EID, and Read Firmware Version. Duration is <100 µs when I²C clock speed is >100 kHz (>200 kHz for 2-byte commands).

SILICON LABS

Table 3. I^{2}C Interface Specifications[1]

$1.9 \leq V_{DD} \leq 3.6$ V; $T_A = -40$ to +125 °C unless otherwise noted.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Hysteresis	V_{HYS}	High-to-low versus low-to-high transition	$0.05 \times V_{DD}$	—	—	V
SCLK Frequency[2]	f_{SCL}		—	—	400	kHz
SCL High Time	t_{SKH}		0.6	—	—	µs
SCL Low Time	t_{SKL}		1.3	—	—	µs
Start Hold Time	t_{STH}		0.6	—	—	µs
Start Setup Time	t_{STS}		0.6	—	—	µs
Stop Setup Time	t_{SPS}		0.6	—	—	µs
Bus Free Time	t_{BUF}	Between Stop and Start	1.3	—	—	µs
SDA Setup Time	t_{DS}		100	—	—	ns
SDA Hold Time	t_{DH}		100	—	—	ns
SDA Valid Time	$t_{VD;DAT}$	From SCL low to data valid	—	—	0.9	µs
SDA Acknowledge Valid Time	$t_{VD;ACK}$	From SCL low to data valid	—	—	0.9	µs
Suppressed Pulse Width[3]	t_{SPS}		50	—	—	ns

Notes:
1. All values are referenced to V_{IL} and/or V_{IH}.
2. Depending on the conversion command, the Si705x may hold the master during the conversion (clock stretch). At above 100 kHz SCL, the Si705x may also hold the master briefly for user register and device ID transactions. At the highest I^{2}C speed of 400 kHz the stretching will be <10 µs.
3. Pulses up to and including 50 ns will be suppressed.

Figure 1. I^{2}C Interface Timing Diagram

Table 4. Temperature Sensor

$1.9 \leq V_{DD} \leq 3.6$ V; $T_A = -40$ to $+125$ °C default conversion time unless otherwise noted.

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Operating Range			–40	—	+125	°C
Accuracy[1]		Si7053	—	±0.2	±0.3	°C
		Si7054	—	±0.3	±0.4	°C
		Si7055	—	±0.4	±0.5	°C
		Si7050	—	±0.5	±1.0	°C
Repeatability/Noise		14-bit resolution	—	0.01	—	°C RMS
		13-bit resolution	—	0.02	—	
		12-bit resolution	—	0.04	—	
		11-bit resolution	—	0.08	—	
Response Time[2]	$\tau_{63\%}$	Unmounted device	—	0.7	—	s
		Si705x-EB board	—	5.1	—	s
Long Term Stability			—	≤ 0.01	—	°C/Yr

Notes:
1. 14b measurement resolution (default). Values apply to the full operating temperature and voltage range of the device.
2. Time to reach 63% of final value in response to a step change in temperature. Actual response time will vary dependent on system thermal mass and air-flow.

SILICON LABS

Table 5. Thermal Characteristics

Parameter	Symbol	Test Condition	DFN-6	Unit
Junction to Air Thermal Resistance	θ_{JA}	JEDEC 2-Layer board, No Airflow	256	°C/W
Junction to Air Thermal Resistance	θ_{JA}	JEDEC 2-Layer board, 1 m/s Airflow	224	°C/W
Junction to Air Thermal Resistance	θ_{JA}	JEDEC 2-Layer board, 2.5 m/s Airflow	205	°C/W
Junction to Case Thermal Resistance	θ_{JC}	JEDEC 2-Layer board	22	°C/W
Junction to Board Thermal Resistance	θ_{JB}	JEDEC 2-Layer board	134	°C/W

Table 6. Absolute Maximum Ratings[1]

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Ambient temperature under bias			–55	—	125	°C
Storage Temperature[2]			–65	—	150	°C
Voltage on I/O pins			–0.3	—	VDD+0.3 V	V
Voltage on VDD with respect to GND			–0.3		4.2	V
ESD Tolerance		HBM	—	—	2	kV
		CDM	—	—	1.25	kV
		MM	—	—	250	V

Notes:
1. Absolute maximum ratings are stress ratings only, operation at or beyond these conditions is not implied and may shorten the life of the device or alter its performance.
2. Special handling considerations apply; see application note, "AN607: Si70xx Humidity and Temperature Sensor Designer's Guide".

4. Functional Description
Figure 3. Si705x Block Diagram

The Si705x Digital Temperature Sensors offer industry-leading low power consumption and high accuracy across the entire operating voltage and temperature range. These monolithic CMOS ICs feature a band-gap temperature sensor element, an analog-to-digital converter with up to 14-bit resolution, signal processing, calibration data, and an I^2C interface. The patented use of novel signal processing and analog design enables the sensors to maintain their accuracy over a wide temperature and voltage range, while consuming very little current.

The temperature sensors are factory-calibrated and the calibration data is stored in the on-chip non-volatile memory. This ensures that the sensors are fully interchangeable, with no recalibration or software changes required.

The Si705x devices are available in a 3x3 mm DFN package, and the industry-standard I^2C interface can operate at up to 400 kHz. Requiring just 195nA of average current when sampled once per second, the Si705x can operate for several years with just a single coin cell battery.

The Si705x devices offer an accurate, low-power, factory-calibrated digital solution ideal for measuring temperature in applications ranging from HVAC/R and asset tracking to industrial and consumer platforms.

5. I^{2}C Interface

The Si705x communicates with the host controller over a digital I^{2}C interface. The 7-bit base slave address is 0x40. When sending commands to the device, the R/W bit is set high for a read command and low for a write command.

Table 8. I^{2}C Slave Address Byte

A6	A5	A4	A3	A2	A1	A0	R/W
1	0	0	0	0	0	0	0

Master I^{2}C devices communicate with the Si705x using a command structure. The commands are listed in the I^{2}C command table. Commands other than those documented below are undefined and should not be sent to the device. When sending commands to the device, the R/W bit is set high for a read command and low for a write command.

Table 9. I^{2}C Command Table

Command Description	Command Code
Measure Temperature, Hold Master Mode	0xE3
Measure Temperature, No Hold Master Mode	0xF3
Reset	0xFE
Write User Register 1	0xE6
Read User Register 1	0xE7
Read Electronic ID 1st Byte	0xFA 0x0F
Read Electronic ID 2nd Byte	0xFC 0xC9
Read Firmware Revision	0x84 0xB8

5.1. Issuing a Measurement Command

The measurement command instructs the Si705x to perform a temperature measurement. While the measurement is in progress, the option of either clock stretching (Hold Master Mode) or Not Acknowledging read requests (No Hold Master Mode) is available to indicate to the master that the measurement is in progress; the chosen command code determines which mode is used.

Optionally, a checksum byte can be returned from the slave for use in checking for transmission errors. The checksum byte will follow the least significant measurement byte if it is acknowledged by the master. The checksum byte is not returned if the master "not acknowledges" the least significant measurement byte. The checksum byte is calculated using a CRC generator polynomial of $x^8 + x^5 + x^4 + 1$, with an initialization of 0x00.

The checksum byte is optional after initiating a temperature measurement with commands 0xE3, and 0xF3. The checksum byte is required for reading the electronic ID with commands 0xFA 0x0F and 0xFC 0xC9. For all other commands, the checksum byte is not supported.
Table 10. I^{2}C Bit Descriptions

| Name	Symbol	Description
START	S	SDA goes low while SCL high
STOP	P	SDA goes high while SCL high
Repeated START	Sr	SDA goes low while SCL high. It is allowable to generate a STOP before the repeated start. SDA can transition to high before or after SCL goes high in preparation for generating the START.
READ	R	Read bit = 0
WRITE	W	Write bit = 1
All other bits	—	SDA value must remain high or low during the entire time SCL is high (this is the set up and hold time in Figure 1)

In the I^{2}C sequence diagrams in the following sections, bits produced by the master and slave are color coded as shown:

Master	Slave

Sequence to perform a measurement and read back result (Hold Master Mode)

S	Slave Address	W	A	Measure Cmd	A	Sr	Slave Address	R	A	Clock stretch during measurement

MS Byte	A	LS Byte	NA	P

A	Checksum	NA	P

Sequence to perform a measurement and read back result (No Hold Master Mode)

S	Slave Address	W	A	Measure Cmd	A	Sr	Slave Address	R	NA	Slave Address	R	NA	Slave Address

R	A	MS Byte	A	LS Byte	NA	P

A	Checksum	NA	P

5.1.1. Measuring Temperature

The measure temperature commands 0xE3 and 0xF3 will perform a temperature measurement and return the measurement value.

The results of the temperature measurement may be converted to temperature in degrees Celsius (°C) using the following expression:

$$\text{Temperature (°C)} = \frac{175.72 * \text{Temp\_Code}}{65536} - 46.85$$

Where:

Temperature (°C) is the measured temperature value in °C

Temp_Code is the 16-bit word returned by the Si705x

A temperature measurement will always return XXXXXX00 in the LSB field.

## 5.2. Reading and Writing User Registers

There is one user register on the Si705x that allows the user to set the configuration of the Si705x. The procedure for accessing that register is described below.

The checksum byte is not supported after reading a user register.

Sequence to read a register

S	Slave Address	W	A	Read Reg Cmd	A	Sr	Slave Address	R	A	Read Data	NA	P
Sequence to write a register

S	Slave Address	W	A	Write Reg Cmd	A	Write Data	A	P

5.3. Electronic Serial Number

The Si705x provides a serial number individualized for each device that can be read via the I^{2}C serial interface.

Two I^{2}C commands are required to access the device memory and retrieve the complete serial number. The command sequence, and format of the serial number response is described in the figure below:

Master	Slave

First access:

S	Slave Address	W	ACK	0xFA	ACK	0X0F	ACK		
S	Slave Address	R	ACK						
	SNA_3	ACK	CRC	ACK	SNA_2	ACK	CRC	ACK	
	SNA_1	ACK	CRC	ACK	SNA_0	ACK	CRC	NACK	P

2nd access:

S	Slave Address	W	ACK	0xFC	ACK	0XC9	ACK	
S	Slave Address	R	ACK					
	SNB_3	ACK	SNB_2	ACK	CRC	ACK		
	SNB_1	ACK	SNB_0	ACK	CRC	NACK	P	

The format of the complete serial number is 64-bits in length, divided into 8 data bytes. The complete serial number sequence is shown below:

SNA_3	SNA_2	SNA_1	SNA_0	SNB_3	SNB_2	SNB_1	SNB_0

The SNB3 field contains the device identification to distinguish between the different Silicon Labs devices. The value of this field maps to the following devices according to this table:

0x00 or 0xFF engineering samples
50 = 0x32 = Si7050

53 = 0x35 = Si7053

54 = 0x36 = Si7054

55 = 0x37 = Si7055

5.4. Firmware Revision

The internal firmware revision can be read with the following I^{2}C transaction:

S	Slave Address	W	A	0x84	A	0xB8	A	S	Slave Address

R	A	FWREV	A	NA	P

The values in this field are encoded as follows:

0xFF = Firmware version 1.0

0x20 = Firmware version 2.0

SILICON LABS

6. Control Registers

Table 11. Register Summary

Register	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
User Register 1	RES1	VDDS	RSVD	RSVD	RSVD	RSVD	RSVD	RES0

Notes:
1. Any register not listed here is reserved and must not be written. The result of a read operation on these bits is undefined.
2. Except where noted, reserved register bits will always read back as "1," and are not affected by write operations. For future compatibility, it is recommended that prior to a write operation, registers should be read. Then the values read from the RSVD bits should be written back unchanged during the write operation.

6.1. Register Descriptions

Register 1. User Register 1

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	RES1	VDDS	RSVD	RSVD	RSVD	RSVD	RSVD	RES0
Type	R/W	R	R/W	R/W		R/W	R/W	R/W

Reset Settings = 0011_1010

Bit	Name	Function
D7; D0	RES[1:0]	Measurement Resolution: 00: 14 bit 01: 12 bit 10: 13 bit 11: 11 bit
D6	VDDS	VDD Status: 0: V_{DD} OK 1: V_{DD} Low The minimum recommended operating voltage is 1.9 V. A transition of the VDD status bit from 0 to 1 indicates that VDD is between 1.8 V and 1.9 V. If the VDD drops below 1.8 V, the device will no longer operate correctly.
D5, D4, D3, D2, D1	RSVD	Reserved

7. Pin Descriptions: Si705x (Top View)

```
     ●
SDA │ 1 │        │ 6 │ SCL
GND │ 2 │        │ 5 │ VDD
DNC │ 3 │        │ 4 │ DNC
```
Pin Name	Pin #	Pin Description
SDA	1	I^{2}C data
GND	2	Ground. This pin is connected to ground on the circuit board through a trace. Do not connect directly to GND plane.
VDD	5	Power. This pin is connected to power on the circuit board.
SCL	6	I^{2}C clock
DNC	3,4	These pins should be soldered to pads on the PCB for mechanical stability; they can be electrically floating or tied to VDD (do not tie to GND).
T$_{GND}$	Paddle	This pad is connected to GND internally. This pad is the main thermal input to the on-chip temperature sensor. The paddle should be soldered to a floating pad.

Si7055-A20-IM	Digital temperature sensor	±0.5 °C	DFN 6	Tube
Si7055-A20-IMR	Digital temperature sensor	±0.5 °C	DFN 6	Tape and Reel
Si7055-A20-YM0	Digital temperature sensor — Automotive	±0.5 °C	DFN 6	Tube
Si7055-A20-YM0R	Digital temperature sensor — Automotive	±0.5 °C	DFN 6	Tape and Reel
Note: The "A" denotes product revision A and "20" denotes firmware version 2.0.				

9. Package Outline

## 9.1. Package Outline: 3x3 6-pin DFN

Figure 10. 3x3 6-pin DFN

Table 13. 3x3 6-pin DFN Package Diagram Dimensions

Dimension	Min	Nom	Max
A	0.65	0.75	0.85
A1	0.00	0.02	0.05
A3	0.203 REF		
b	0.35	0.40	0.45
D	3.00 BSC.		
e	1.00 BSC.		
E	3.00 BSC.		
D2	2.30	2.40	2.50
E2	1.4	1.5	1.6
K	0.20 MIN.		
L	0.35	0.40	0.45
N	6		
ND	3		

Notes:
1. All dimensions shown are in millimeters (mm).
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.

10. PCB Land Pattern and Solder Mask Design
Figure 4. Si705x PCB Land Pattern

Table 14. PCB Land Pattern Dimensions

Symbol	mm
C1	2.90
E	1.00
P1	1.60
P2	2.50
X1	0.45
Y1	0.85

Notes:
General

1. All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.
2. This Land Pattern Design is based on the IPC-7351 guidelines.

Solder Mask Design

3. All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 μm minimum, all the way around the pad.

Stencil Design

4. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
5. The stencil thickness should be 0.125 mm (5 mils).
6. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pins.
7. A 2x1 array of 1.00 mm square openings on 1.30 mm pitch should be used for the center ground pad to achieve a target solder coverage of 50%.

Card Assembly

8. A No-Clean, Type-3 solder paste is recommended.
9. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

11. Top Marking

11.1. Si705x Top Marking
11.2. Top Marking Explanation

Mark Method:	Laser	
Pin 1 Mark:	Circle = 0.30 mm Diameter (Upper-Left Corner)	
Font Size:	0.05 mm	
Line 1 Mark Format:	Device Code	Si7005
Line 2 Mark Format:	TTTT	Manufacturing Code from the Assembly Purchase Order form.
Line 3 Mark Format:	YY = Year WW = Work Week	Assigned by the Assembly House. Corresponds to the year and work week of the assembly release.
